

Long-Term Lake Fluctuations Related to MFL Assessments

Presented to NTB II (LTPRG)

December 12, 2007

Donald L. Ellison
Senior P.G. Hydrologic Evaluation Section

Today's Topics:

- Review of MFL Terminology
 - Historic
 - Current
 - Structural Alteration
 - Long-Term
 - P10
 - P50
 - P90
 - Minimum Lake Level
 - High Minimum Lake Level
 - High Guidance Level
- Analysis of Long-Term
- Lake Stage Fluctuation Statistics Used to Set Lake Minimum Levels
 - Perfect World Example
- Tying Climate and Minimum Lake Levels Together

Structural Alteration:

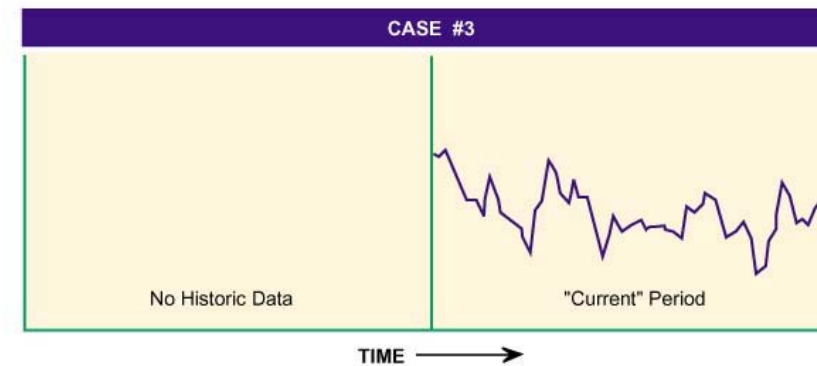

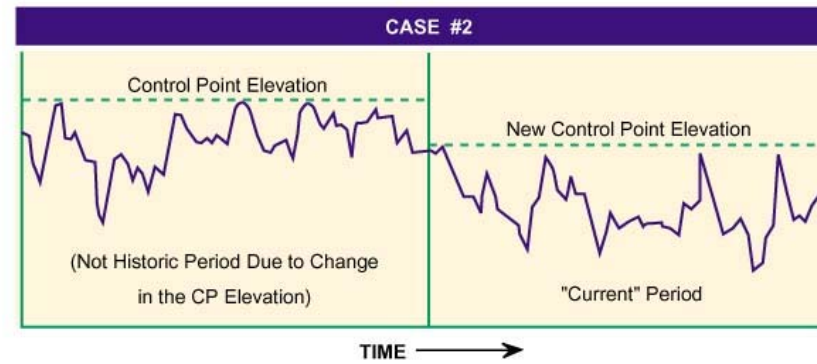

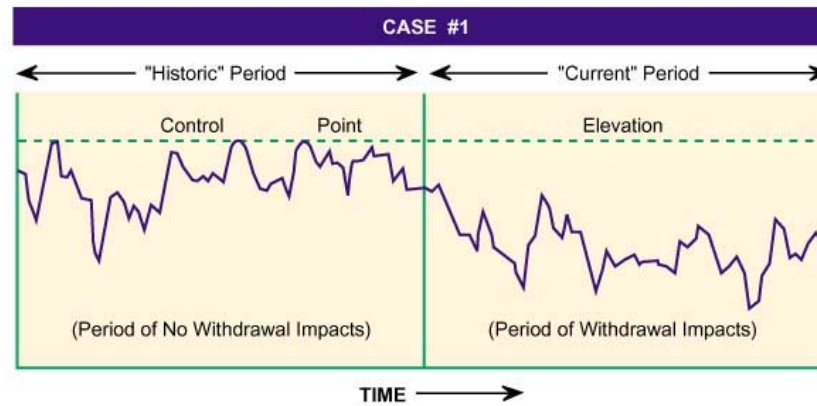

- Change to the conveyance system of the lake that changes the lake stage fluctuation in a measurable manner.
- Usually, but not always, it involves a change to the outlet of the lake.
- Can include downstream alterations that result in tail water effects.
- Can include up stream changes that either increase or decrease flow to the lake.
- We recognize sinkholes during compliance evaluation, but usually don't set the level based on them.

Historic

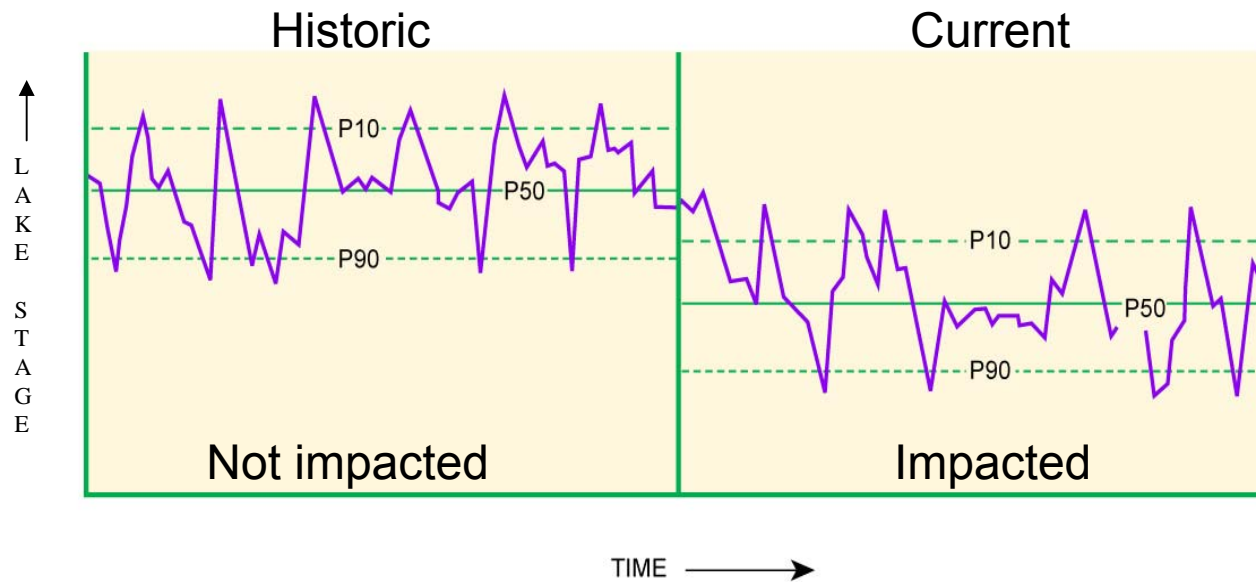

1. Period with no measurable groundwater or withdrawal impacts
2. Structural conditions same as now
3. No Augmentation
4. No Augmentation

Current

1. ~~No~~ Groundwater or withdrawal impacts
2. Structural conditions same as now
3. No Augmentation

Data limitations encountered that required use of the reference lake water regime of define lake fluctuation absent withdrawal impacts.

P10 = Elevation the lake stage is equal to or above 10% of the time

P50 = Elevation the lake stage is equal to or above 50% of the time

P90 = Elevation the lake stage is equal to or above 90% of the time

Minimum Lake Levels are Long-Term Percentiles

- Minimum Lake level is the Historic P50 minus some offset.

MLL represents a new P50 value

- High Minimum Lake Level is the Historic P10 minus some offset.

HMLL represents a new P10 value

- High Guidance Level is the Historic P10 (i.e. no offset)

HGL = Historic P10

Analysis
Of
“Long Term”

Chapter 40D-8 defines long-term as:

"Long-term means an evaluation period utilized to establish Minimum Flows and Levels, to determine compliance with established Minimum Levels and to assess withdrawal impacts on established Minimum Flows and Levels that represents a period which spans the range of hydrologic conditions which can be expected to occur based upon historical records, ranging from high water levels to low water levels. In the context of a predictive model simulation, a Long-term simulation will be insensitive to temporal fluctuations in withdrawal rates and hydrologic conditions, so as to simulate steady-state average conditions. In the context of an average water level, the average will be based upon the historic expected range and frequency of levels. Relative to Minimum Flow establishment and Minimum Level establishment and compliance, where there are six years or more of competent data, a minimum of a six-year evaluation period will be used, but available data and reasonable scientific judgment will dictate whether a longer period is used. Where there are less than six years of competent data, the period used will be dictated by the available data and a determination, based on reasonable scientific judgment, that the period is sufficiently representative of Long-term conditions"

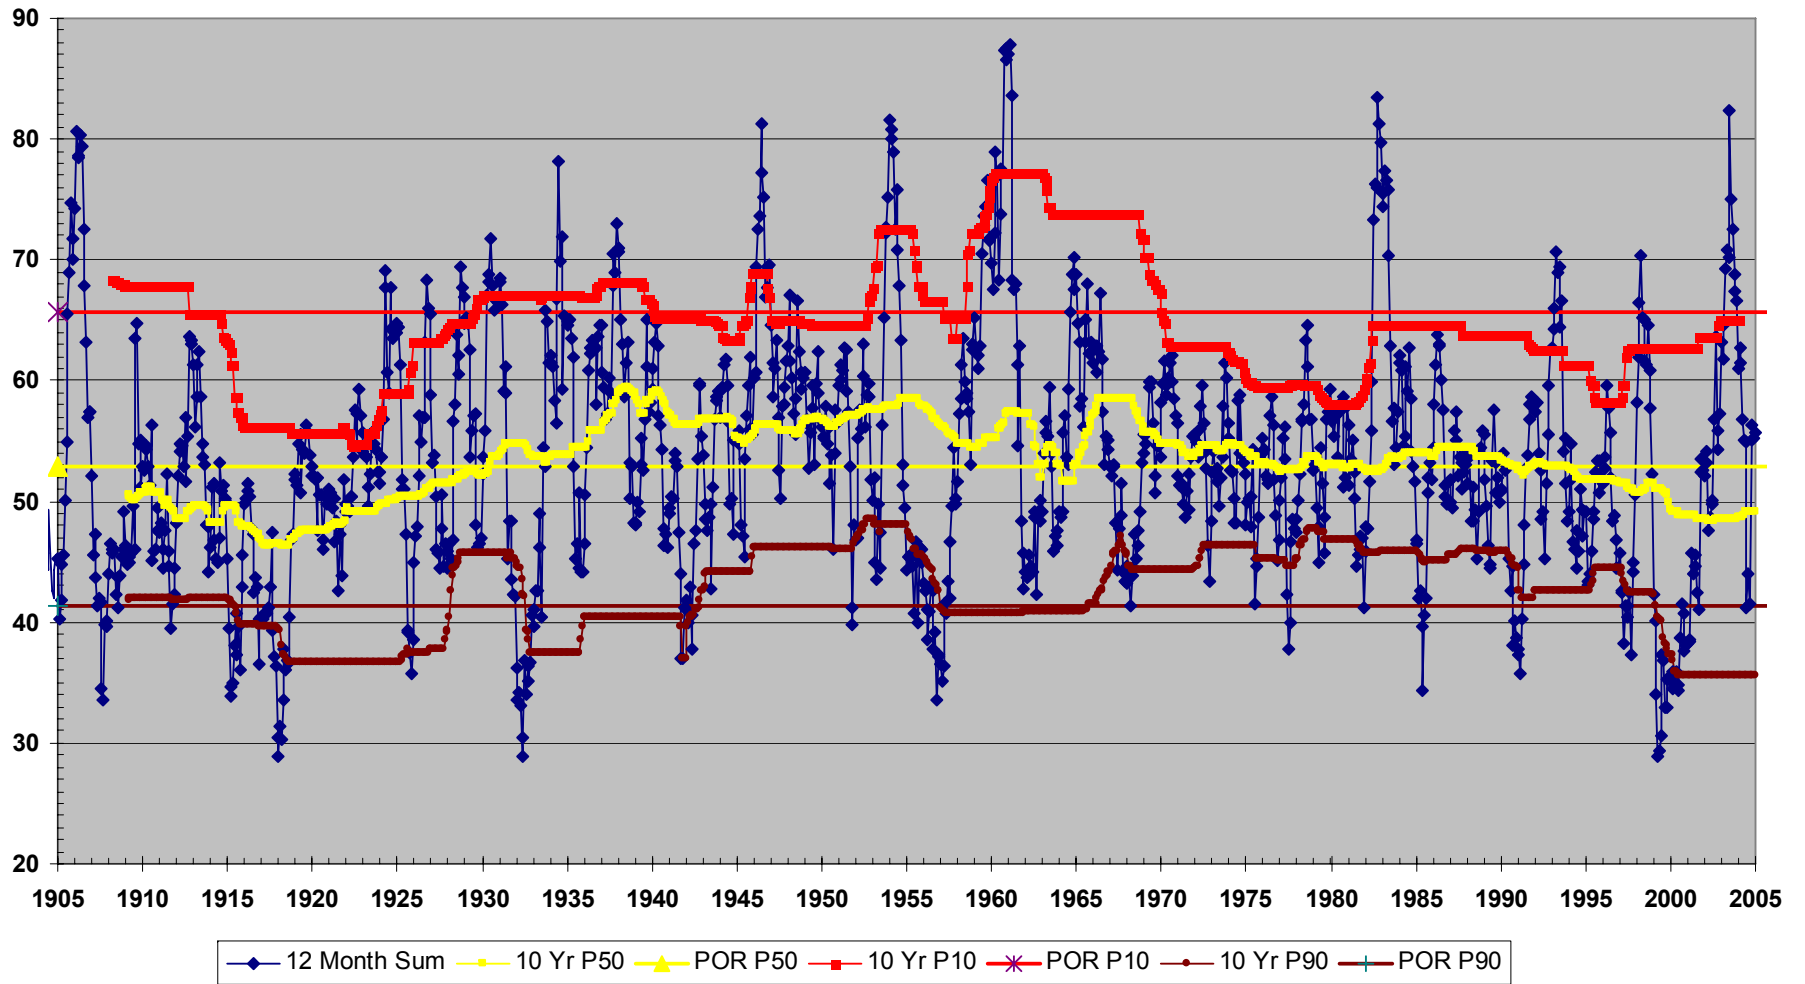

Long-Term is at Least 60 + Years

(Actually there are cycles in cycles, that will keep producing new values but we are setting a limit at 60 to 100 years)

Fact:

1. Percentiles calculated with shorter windows of time will cycle above and below the longer term percentile.
2. The shorter the window of time the larger the variation around the long-term.

What is long term?

- One way to answer it is determine how much data is required before adding more data doesn't significantly change the median.
- How much uncertainty can we accept?
($\pm 0.5'$, $0.1'$?)

Calculating Lake Stage Fluctuation Statistics Used to Set Lake Minimum Levels

In a perfect world you have long-term historic data and it's very easy!

Calculate the Historic P50 using the data and apply the appropriate offset.

Lake Example

We never have a perfect world situation.

- **Need method to calculate Long-Term Historic P50.**
- **Need a method to estimate what the natural stage of the lake should be at any moment based on preceding climatic conditions**

Typical lake has less than 20 years and very frequently has no historic data.

How are we handling this?

- 1. Old Way - Reference Lake Water Regime concept**
- 2. New Way – Climate Based Models**

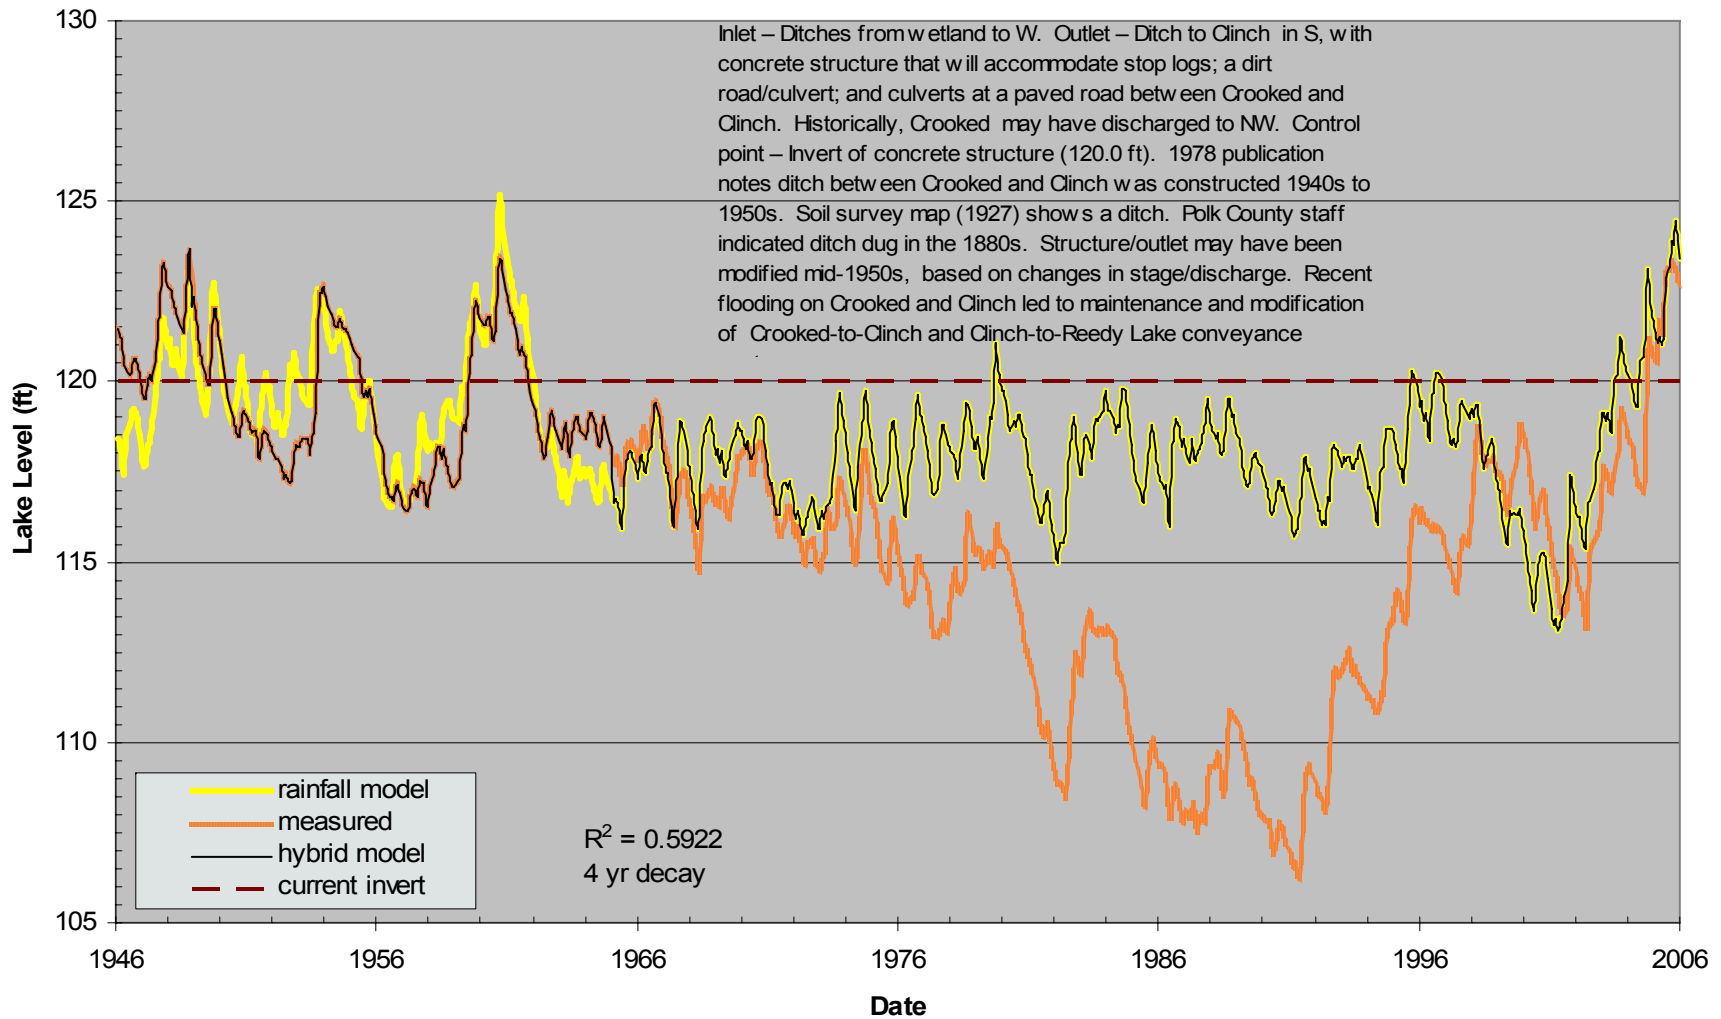

Goal: Estimate Lake Stage Given Climatic Conditions
