Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Lassie Lee gave the following reason for signing this petition:

"Florida requires water - pure, clean water - for life. Too many people and too many "business" demands are killing this state. We have to stop the downward trend now to have a liveable future."

8682 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Laverne Garrett gave the following reason for signing this petition:

"We own property on the Chassahowitzka River our future home. We are concern about the damage to the river."

9425 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Leitha Bowles gave the following reason for signing this petition:

"These are spring fed coastal rivers, which need to be protected from further salt water encroachment, they are habitat to fresh water species and the cold provides live- saving thermal refuge to endangered Manatees during winter months.

"

2634 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Linda Golden gave the following reason for signing this petition:

"We are losing too much of our natural habitats."

8330 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

LINDA STAPLETON gave the following reason for signing this petition:

"I live here, and am tired of seeing the natural beauty of our state's flora and fauna being destroyed for no good reason. Usually it's from big business and to preserve wealthy residents lakefront property, but this degradation serves no purpose at all (unless it's one we haven't learned yet)."

9869 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Lisa Hoffman gave the following reason for signing this petition:

"As Floridians, we should be protecting our wildlife especially endangered."

2792 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Lucia Ross gave the following reason for signing this petition:

"If not for the intrinsic value of the animals themselves -- which in my mind is paramount -- Florida is a tourist economy. If you don't protect the very things that draw tourists to a particular area, you will lose money. Hopefully, I've put my argument in terms that politicians understand -- economic."

3394 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Lynn Polke gave the following reason for signing this petition:

"Nature nurtures and supports us all. "

10120 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Shellie Ferreira-Lee

From: Madeline Gutierrez [mailto:change.org]
Sent: Saturday, October 27, 2012 5:29 PM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Madeline Gutierrez gave the following reason for signing this petition:

"here are only plus or minus about 5,000 West Indian Manatees.

The springs covered in this petition – the Homosassa and Chassahowitzka Springs - are very important to the species survival.

Two reasons for example are:

One reason is because when water temperatures drop to unusually harsh for standard Florida winter months, manatees must seek warmer waterways to stay alive.

Manatees, though large, are not well protected by a blubber layer unlike many sea mammals. Manatees can't take waters colder than 68 degrees F. for more than a few hours. They are warm blooded animals and will freeze to death or become mortally ill from the cold just like a human being would. The Homosassa and Chassahowitzka springs are some of the few warm water areas instinctually used by the Manatees during these times.

The second issue is that these waterways are what are keeping the manatee populations at their current levels.

For animals to survive scientists and naturalists have discovered that any species needs a certain amount of their unique supporting habitats where they can live in to survive. This is called their "support level." Human beings are very adaptable and can mold areas to support them with electricity, heaters, and foods trucked in to them, etc. Manatees don't. Without spring systems the manatees will lose a drastic amount of sheltering and feeding places.

Please see this article specifically mentioning "the spring at Ellie Schiller Homosassa Springs Wildlife State Park" as being influential in attempts to stop Manatee deaths during unusually cold weather:
<http://bit.ly/OrlSentManateesWarm>

How important is this to the manatee's population and survival?

The answer can be found in another quote from a well researched and well respected news source: "A record-topping 767 manatees died in 2010, with cold stress accounting for as many as 500 deaths, say figures released Wednesday by the Florida Fish and Wildlife Research Institute in St. Petersburg."
<http://bit.ly/TampaBay767DeadManatee> . That means at least a 10th of the Indian Manatee population, possibly almost twice that much.

Is saving the manatees important?

If you are not concerned about the extinction of a large warm blooded species that only lives primarily in one of our states – Florida - out of all the world, you may perhaps be concerned about the welfare of humans that live

in Florida.

Manatee Ecotourism

Do manatees really matter all that much?

“Manatees are also worth a fortune. Though there are no exact numbers on how much revenue manatee ecotourism generates for the State of Florida, in 2008 the Sierra Club reported that wildlife viewing generated more than \$3.1 billion in total economic impact for the state. With manatees being a major draw, some significant portion of that is, undoubtedly, going to counties that market their winter habitat for manatees.” This was reported in a Living Green Magazine July, 2012, article. <http://bit.ly/Y8aj31>

These springs are significantly located right alongside the same coast where so many livelihoods were destroyed by the BP oil spill. BP acknowledges they made a mistake in maintaining their oil drilling.

Mistakes like the BP oil spill happen and can that cause irreparable damage.

Please do not allow the mistake of these springs, which have already been Federally designated as "Florida Outstanding Waterways, to be decided by as small and self focused a group as the “Governing Board of the South West Florida Water Management District” (SWFWMD). These waterways and many of the animals that live there, such as the Indian Manatee, are unique and once gone – irreplaceable.

An excellent review has been conducted by the U.S. Fish and Wildlife Service (FWS, Service, or USFWS) staff from the Jacksonville and Caribbean Ecological Services offices and answers many questions about Florida manatees.

It can be found at: <http://1.usa.gov/S4bLzt>

I hope my writing gives you some of the information needed to understand why concerned citizens should respond to the SWFWMD's Governing Board and tell the Governor of Florida: “NO reduction in flow to the Homosassa and Chassahowitzka River.”

That can be done on this petition at:

<http://chn.ge/XBfV6H>

or tweeting Florida Governor Rick Scott at:

<https://twitter.com/FLGovScott> or @FLGovScott

"

These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Marian Wood gave the following reason for signing this petition:

"I love our rivers and appreciate the pristine beauty that is not found in any other area. We need to protect our beautiful area. "

9716 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Sent: Saturday, October 27, 2012 8:26 PM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Marie Trone gave the following reason for signing this petition:

"I canoe on Chassahowitzka and Homosassa springs regularly. My dogs enjoy swimming there as well. One of my all-time photographs is of a manatee in Chassahowitzka. We cannot afford to reduce the flow of this spring, as it is already incredibly low. We need to conserve this water for the future of not only the wildlife, by our children and grandchildren. Please do not let corporations, large scale ranchers, etc pressure you into giving them a larger allotment of water for the sake of "jobs". That is pure lip-service. Orlando has been listed in the top 10 cities for having demand exceed supply for fresh water by Wall Street. What businesses are going to come to Orlando knowing that the business and its workers have a water shortage???? Please think this through. I have facts, and I can give them to you. I teach Environmental Science at Valencia College in Kissimmee."

Shellie Ferreira-Lee

From: Marina Fitoria [mailto:change.org]
Sent: Saturday, October 27, 2012 2:03 PM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Marina Fitoria gave the following reason for signing this petition:

"The Bible and the Judaic-Christian tradition teach and command us to treat animals with kindness and respect. The massive abuse and suffering legally inflicted on billions of animals every year is a clear violation of the teachings of our religious faith and cannot be justified by any person of faith and decency. The people for whom the Bible was written thousands of years ago were intimately familiar with wildlife and domestic animals, especially the practice of raising cattle and other animals. The Bible contains strict rules governing the treatment of farmed animals, and indeed all of God's creatures, which were designed to prevent any unnecessary pain and suffering. Modern day animal agriculture violates core Christian values. It wipes out entire populations and species of wildlife, confines huge numbers of animals in miserable conditions on factory farms, damages the environment, squanders scarce resources, and harms the health of people.

The Ten Commandments:

Do Not Overwork

Animals

T

he Mosaic Law in the Hebrew Scriptures forbids overworking animals and requires that people help stray and lost creatures. Many injunctions are clearly written for the sake of the creatures and not the owners.

The Law requires that

one help animals who
belong to enemies to
whom one owes no obligation, as well as those
of friends. One may
not "pass by" an
animal in distress: "If you
meet your
enemy's ox or
his ass going
astray, you shall
bring it back to him."
"

These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Sent: Saturday, October 27, 2012 5:26 PM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Marlene Gentile gave the following reason for signing this petition:

"As a former teacher, I can recall how my students admired manatees as one of the oldest and gentlest creatures on earth. Several times there was a public outcry to keep speed boats from mangling these creatures, and the students felt empowered by participating in initiatives to help our earth. It always seems to come down to a toss up between humans getting their way, no matter the reason, and the natural world takes a back seat. Once the planet is decimated, humans will be the one to take the back seat because we will not survive."

From: Martyn Johnson [mailto:change.org]
Sent: Sunday, October 28, 2012 8:22 AM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Martyn Johnson gave the following reason for signing this petition:

"PREVENTION of further degradation NOW, is BETTER than CURE at some future date.

There are already too many examples of rivers where the cure is verging on the impossible. Those situations could have been avoided with some thoughts of prevention.

Our neighbors, some who have lived in the area all their lives, tell of the longer term deterioration. The models are questionable as they are based on many assumptions, often made by people at a computer without even having seen the rivers. Look at the real facts not those generated from a myriad of assumptions in a computer model and you will realize how little is known by those computers about these complex spring systems that are so vital to both the ecology and economy of the area.

Please vote to stop Destruction by Suction (destroying the Homosassa and Chassahowitzka by sanctioning more groundwater withdrawals, and let us not forget Crystal River)."

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Mary Aker gave the following reason for signing this petition:

"The people of Florida love the manatees. We love to see them and touch them and preserve them so our children can get to know these wonderful creatures.

"

8832 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Mary Warren gave the following reason for signing this petition:

"Maintaining the delicate web of life means that we are responsible Earth citizens and are playing our part to foster God's creation."

2753 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Max Christy gave the following reason for signing this petition:

"Save the manatees"

6805 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

melynda rydbom gave the following reason for signing this petition:

"Florida's environment is important to me
"

7602 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Michelle Anthony gave the following reason for signing this petition:

"I have been a wildlife rehabilitator for 20 years and have seen the devastating effects of humans on wildlife. "

10806 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Missy Patrick gave the following reason for signing this petition:

"Because I live here and kayak those springs"

9033 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Sent: Sunday, October 28, 2012 11:31 PM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Mystina Swaim gave the following reason for signing this petition:

"Manatees have been a great passion of mine from a very young age. When first learning about these amazing gentle giants, I studied about them and dreamed about getting to meet one up close. My dream came true when I swam with wild manatees in Crystal River, FL in 2004. I was able to experience this great opportunity and further extend my dream to working with them during my college internship. Manatees have and always will be an important part of my life and we need to do all we can to protect them for future generations. Manatees are not only an important part of the environment, but an important part of Florida's culture as well as a symbol of gentleness and tranquility we can all learn from. "

It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Nancy Elizabeth Markovich gave the following reason for signing this petition:

"Manatees are losing population and are unique to Florida. They also eat weeds that choke up beautiful springs"

2361 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Pam Bucci gave the following reason for signing this petition:

"Because animals are beautiful and should be protected. They can't defend themselves."

9891 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Pam Cohen gave the following reason for signing this petition:

"I am extremely concerned that Florida officials do not care about Florida's or any state's natural wildlife and ecosystem.

Marco Rubio just wrote that he's for The Sportsmen's Act of 2012, a very dangerous act that's geared for self-absorbed recreational hunters that will lead to the destruction of animal protection agencies and conservation on public land. Please google this.

Marco Rubio also voted against stronger anti-dog fighting laws.

The people up north say this state is so backwards and I've always defended it, but now, some of the people representing us are embarrassing and I agree it's true.

Do the right thing for our unique and important manatees. At all costs do not reduce the flow to these rivers."

10538 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Pat Bayers gave the following reason for signing this petition:

"Manatees are a treasure and must be protected. Flow reductions will threaten them."

7515 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Patricia Junior gave the following reason for signing this petition:

"I live on a canal off the Homosasa River, and I would like to see the quality and quantity of the river not be compromised"

8898 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

peter fernandez gave the following reason for signing this petition:

"why isn't this important to everyone else"

2812 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Peter Mercauto gave the following reason for signing this petition:

"As a lifelong Florida resident, I treasure both the Chassahowitzka and Homosassa Rivers. Some of my earliest memories are of my family making the 60 mile trip to enjoy the (then) pristine Chassahowitzka. Since then, development has abused and degraded both rivers to the point that the last time I visited both rivers, a few years ago, it brought tears to my eyes. The abuse needs to STOP and stop NOW!!"

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Phyllis J Smith gave the following reason for signing this petition:

"I lived in central Florida for 25 years and still love the manatee's"

7976 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Rebecca Gravely gave the following reason for signing this petition:

"This is important to me because manatees are important to Florida!"

5490 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Robert & Virginia Svoboda gave the following reason for signing this petition:

"We live on the head of the Halls River, which flows into the Homosassa River. In the twenty years that we have lived here, we have seen the steady decline in the fresh water springs that feed the Halls & Homosassa Rivers. There is more salt water intrusion, lack of fish and natural vegetation, which is essential to the survival of our manatees, Osprey and all wildlife. We feel that any reduction in flow of these rivers, should be stopped immediately."

2884 other people have also signed the following message:

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Robert Dallas gave the following reason for signing this petition:

"These are considered 'Florida Outstanding Waterways' and ome to many endangered species. Nothing should be done to degrade these two waterways. NOTHING!"

10536 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosasa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Robert Mills gave the following reason for signing this petition:

"I am a resident of Chassahowitzka and I feel that any change to the flow of our spring will be devastating. The spring and river is already severely stressed and any reduction in flow threatens its existence. We must protect this valuable resource and the animals that depend on it. Why do we continue to mess with these springs? The obvious answer is to steal the water for someone else's use. If we continue this trend there will be no spring."
"

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Robert R Rupe Jr gave the following reason for signing this petition:

"We can't keep giving water out to everyone. We have to protect our Aquifers."

4158 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Rosanne Ingoglia gave the following reason for signing this petition:

"Wildlife endangerment...please act responsibly and leave the water ways alone. "

8641 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

S Young gave the following reason for signing this petition:

"We need to get rid of all the bottling plants, encourage agriculture to employ water-wise irrigation, get golf courses to use reclaimed water, and do all we can to protect our Aquifer - for humans and all of life, not just manatees."

10716 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Sandra Leaper gave the following reason for signing this petition:

"Manatees are endangered, they rely on essential fresh water and warmth in winter. Gulf is too cold."

6125 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

6156 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Sher Briccol gave the following reason for signing this petition:

"Animals have the Right to Life."

4413 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

SHIRLEY MAKSYMICZ gave the following reason for signing this petition:

"To save our water life and preserve our water ways as God has intended when He created them."

2666 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Stephanie Ford gave the following reason for signing this petition:

"These awesome giants can teach us so much and it's important to stand up for these creatures since we are held responsible for all creatures of the earth. This "

2292 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

8628 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Tara Marr gave the following reason for signing this petition:

"Mess with there waters your messing with me. These awesome mammals deserve better than this sham on you!!!! "

2527 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Teresa Gail Stark gave the following reason for signing this petition:

"Teresa Gail stark"

4087 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.
