FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Charles Wiggins gave the following reason for signing this petition:

"It does not take a rocket scientist to understand the ramifications involved to the wildlife. They are much more important than someone making money off of this."

4533 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Christopher Wilson gave the following reason for signing this petition:

"I grew up on the Chassahowitzka and have already seen the flow greatly reduced. Enough is enough. "

10799 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

cindy klein gave the following reason for signing this petition:

"chassahowitzka is my home, i have seen first hand, over many years the flow of our springs decline, not just here, but statewide. coastal springs will die first, then our interior springs will cease. ground water pumping will continue, then, when we suck it all dry, we will begin what we should have already started years ago. desalinization, it will come to that eventually anyway, why not start now. lets lead the way to the future and restore our springs, i say no to increased pumping of our most precious recourse, stop ground water pumping now. given the chance, nature will heal itself, it would be a great loss if we continue on the current path.

"

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

CJ King gave the following reason for signing this petition:

"Please, don't do this. You will be hurting a treasure of the Florida wildlife."

4046 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Cody Bellamy gave the following reason for signing this petition:

"Natural wildlife needs to be saved. Especially if they are going extinct."

7505 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Covington Campbell gave the following reason for signing this petition:

"Manatees are an important part of our ecosystem."

2327 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Damian Beu gave the following reason for signing this petition:

"Being a Florida resident, myself, I value our habitat, and the lives within our ecosystem. Follow an Ego-System, and everyone and everything suffers at the expense of making oneself look good to the rest of the gang. We have enough problems as they are (on the political front, especially), and sanctuaries are few enough, as is. To eliminate our habitats, for the sake of looking good for your peers is a dick move, especially towards nature in this case.

Be wise about this. I can guarantee your kids/grandkids would want to see manatees and dolphins. If you want to stay good with them, I suggest you listen to us, and don't go through with the reduction."

6792 other people have also signed the following message:

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Dana House gave the following reason for signing this petition:

"My family has been here since the 1880's. I continue to watch the destruction on our ecosystem. Since politicians seem to respond to dollars, have you considered the billions that will be lost to Florida's major income source by this continued destruction?"

9454 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Dave Abel gave the following reason for signing this petition:

"I VISIT THESE SPRINGS REGULARLY AND KAYAK DOWN THE RIVERS. LEAVE THEM ALONE"

6346 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

David Raines gave the following reason for signing this petition:

"If we don't love nature we need to get a change of Attitude! Loving nature is akin to loving ourselves and not is akin to planing our own murder."

6374 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosasa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Sent: Friday, October 26, 2012 9:12 PM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Dee Atkins gave the following reason for signing this petition:

"Our rivers are already in critical condition and to allow any percentage at all in flow reduction is unconscionable. SWFWMD already allows water use permits to be issued for the cost to \$50 and no metering when someone 'says' they are only going to take 50,000 gallons per day. Of course, with no metering, how do they know how much water is being taken? Crystal River is going to be the next for MFL's to be set, and if permits without metering are already being issued, it scares me to death what they will do setting MFL's. The water permit issued recently is being transported to Ocala to be sold as bottled water. Water transfer!! And no metering on how much is really being taken. SWFWMD is allowing flow reduction in rivers that are already dying or dead. Data that is being used to justify this action can be manipulated to provide the desired results. Use common sense....look at the rivers....look at the lack of aquatic plants that are conducive to the rivers.....look at the salinity in areas that used to be fresh water....look at the decrease in wild life, fish, and flora and fauna, look at the degradation of our springs. It is obvious to the lay person what it happening...surely the scientists are smart enough to see what's going on without graphs and numbers and such. If we, the people who love are waterways can see what's happening, there's no data in the world that can change what is obvious to those of us who are aware and feel the pain of watching our rivers and our wildlife die."

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Denise Ragsdale gave the following reason for signing this petition:

"The destruction of wildlife habitat in Florida must end. All creatures on this planet deserve the right to exist - not just humans! Some control of the water use by humans needs to be exerted as soon as possible. Haven't we pumped enough water to St. Petersburg and surrounding areas from outside their borders? When will the development end. Stop killing the wildlife that makes this planet worth living on."

6970 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Don Love gave the following reason for signing this petition:

"Enough is enough."

9430 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Dona Gould gave the following reason for signing this petition:

"Why do they want to reduce the flow? For business? For farming? It really seems more important than either of those to protect our waterways natural flow and stop destroying our habitat. All the little things are already adding up and showing how quickly we are destroying the beautiful world we are supposed to be protecting. Quality of life is more important than money."

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Donna Mavity gave the following reason for signing this petition:

"I don't believe in human progress destroying wildlife. Why are humans more important than animals? We are supposed to be the caretakers of the earth and its inhabitants. Not destroyers"

8922 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Dot Riffel gave the following reason for signing this petition:

"For all the reasons stated in the letter. We need the companionship of God's creatures"

3625 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Ellen Norbom gave the following reason for signing this petition:

"Because the manatees are endangered and are a very special anima."

6187 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

erica nord gave the following reason for signing this petition:

"Manatees are beautiful endangered species

"

10586 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

francis butera gave the following reason for signing this petition:

"Minimum Flow levels were set to protect the biological health for entire ecosystems. Disregarding these levels will cause a permanent and acute negative reduction in the biological health and balance of these systems. "

8073 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

gabe miller gave the following reason for signing this petition:

"Because it disgusts me that my governor wouldn't take the necessary steps to help protect an endangered species. If this goes through he will have forever lost my vote."

4688 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Geraldine Carboni gave the following reason for signing this petition:

"I am both a resident of NYC and Florida. Until about 20 years ago, I didn't even know manatees existed. We need to preserve these "gentle giants" for our grandchildren's grandchildren."

9196 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Grace McCullohs gave the following reason for signing this petition:

"manatees are already threatened by human actions and they have nowhere else to go
"

6613 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Heather Campbell gave the following reason for signing this petition:

"Rick Scott has no regard for the environment what-so-ever. Good luck with this petition against his anti-green administration. "

2530 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Sent: Sunday, October 28, 2012 12:39 AM
To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Hilary Kacser gave the following reason for signing this petition:

"Manatees are endangered. Reducing fresh water flow to the two spring-fed rivers will let the water get too cold for the manatees and too brackish for fresh water species to survive.

Numerous rare and imperiled species of plants and animals -- from Old Growth Cypress and terrestrial orchids to Southeastern Fresh Water Mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, and Manatees (and many, many more) -- rely for survival on the spring runs and fresh water habitats of the greater Chassahowitzka-Homosassa spring-fed Riverine Swamp Sanctuary and associated fresh water forested wetlands.

Do not further "degrade" the Chassahowitzka and Homosassa spring-fed fresh water ecosystems. Do not risk "extirpating" forever these spring-fed fresh water ecosystems by increased salt water intrusion. "

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Irene Pilinger gave the following reason for signing this petition:

"I love manatees and go to visit the parks to see them every winter."

2556 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Jack Rogers gave the following reason for signing this petition:

"In the last decades we have seen continued degradation of our precious springs across Florida. We need to stop the damage now. I ask that you act now to preserve these most precious resources before they are lost. "

3672 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Jack Schofield gave the following reason for signing this petition:

"Maintaining existing flows is important to the economy of Florida. While populations will increase in the state the reduction of our flow levels of our rivers and springs to provide water resources is not an effective way to provide for future growth. In fact it will affect the areas in the state that provide an opportunity to view Florida in its natural state.

Living on the Withlacoochee River in Yankeetown for the first time since I moved here we had salt water intrusion at our property. Maintaining current flow levels is a must.

Jack Schofield

Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

James Stewart gave the following reason for signing this petition:

"I am both a kayaker and a drinker of this water. It needs protected!"

10658 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Janet Baksh gave the following reason for signing this petition:

"Manatees are very sensitive creatures, and they're having enough trouble surviving without people deliberately altering their habitat!!"

6234 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Janice McSween gave the following reason for signing this petition:

"Haven't we destroyed enough of Florida's wilds and wildlife? "

7386 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Jaxs Powell gave the following reason for signing this petition:

"Manatees are an endangered species and therefore are protected. Reducing the fresh water flow destroys their home and the homes of many other wildlife. It is irresponsible and a crime against earth, animals and humans. "

2097 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Jill Jacoby gave the following reason for signing this petition:

"We are the only place in the world where you can swim in the springs with the Manatee! We love them and they love us!"

2009 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Joan Wertheimer gave the following reason for signing this petition:

"We need to save all of our wildlife before it is too late which sometimes happens"

10160 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Joe Snavely gave the following reason for signing this petition:

"We need to do all that we can to protect these wonderful and majestic creatures. We need to respect our wonderful natural resources and these magnificent animals are unique in all the world."

8210 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Joyce Bowers gave the following reason for signing this petition:

"Manatees are harmless animals and I enjoy seeing their playful behavior in the canals we must protect them! "

6388 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Judith Raymond gave the following reason for signing this petition:

"I live 10 mins. away from Blue Spr. State Park, and the manatees are the park's "claim to fame." For a well used state park, I want manatees in the water! Judy"

5698 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

julie moss gave the following reason for signing this petition:

"safe places for manatees is very important."

4928 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Katherine Vale gave the following reason for signing this petition:

"To avoid further environmental degradation and reduction of species I feel we all have a moral and aesthetic imperative to preserve nature's gifts."

9299 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Kathleen Wedzik gave the following reason for signing this petition:

"reduction in natural spring flow will cause loss of natural habitat in each of these fragile spring-fed fresh water coastal ecosystems."

4236 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

kathy nichols gave the following reason for signing this petition:

"i have lived in Florida for two years and i have not seen very many of them yet "

3259 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Keith Larson gave the following reason for signing this petition:

"I live and fish here and enjoy the wildlife. Instead of pumping more water out, start restricting subdivisions and require new residents to acquire more land, like all 10 acre parcels and that would start helping our water situation. Also quit pumping to other counties. If a county can not provide enough water for a new resident, than they can't sell another building permit until they figure another way, like desal plants."

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

To: Executive
Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Kenneth Jaquith gave the following reason for signing this petition:

"Swflwmd has shown that its "studies" and "best available data and assumptions" have not stood the test of time. Just look at the sad state of the Everglades flow, St. Lucie and Caloosahatchee rivers with the blooms and salt water intrusion. Yes, we have a water flow problem due to the population explosion of our great state. I fear that it is only a matter of time before the state is tapped of the things that make it Florida. What will be left? Beaches and Condominiums? Start by getting rid of the sugarcane fields! "

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Kim Carless gave the following reason for signing this petition:

"Why is it so important to stem the flow?"

3852 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees,

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.

These rare springs and sacred cenotes, and the sprawling fresh water forested wetlands they infuse are National Treasures, arguably World Heritage Sites that should be preserved and protected for future generations (of humans and wildlife).

The undersigned implore SWFWMD's Governing Board, the State Legislature, and the Governor of Florida to deny any further reduction in flow to the spring-fed Homosassa and Chassahowitzka Rivers.

Please say "NO" to reductions in flow to the Chassahowitzka and Homosassa Rivers.

Thank you.

Subject: No Reduction in Flow to the Spring-fed Chassahowitzka and Homosassa Rivers

Kristen Cavallini-Soothill gave the following reason for signing this petition:

"Balance of Nature is teetering, and these beautiful animals need somewhere to live. And...We are ALL God's creatures which certain profiteering individuals seem to forget some of whom also PREACH a good line! Greed must GO."

8775 other people have also signed the following message:

Greetings,

Dear SWFWMD Governing Board,

We implore you to deny any reductions in flow to the spring-fed Chassahowitzka and Homosassa Rivers.

Both of these "Florida Outstanding Waters" have already experienced substantial degradation and now urgently need your help in Restoring them to to the more pristine, natural conditions present at the time of their designation as Outstanding Florida Waters.

The spring-fed Chassahowitzka and Homosassa Rivers are home to Federal and State Listed Endangered Species, including the West Indian Manatee, that rely on the fresh water habitats for their continued survival. These rare springs and the myriad of fresh water fish, birds, and wildlife that they support are also essential to the area's Eco-tour and fishing economy.

Endangered West Indian Manatees rely on the Homosassa and Chassahowitzka Springs for life-saving thermal refuge and essential fresh water habitat. Generations of Manatees return to the Chassahowitzka and Homosassa springs annually to take refuge in the life saving warm spring waters, and without these familiar winter refuges, Homosassa and Chassahowitzka's returning manatees would perish.

Any further reduction in fresh water flow to the springs could allow further encroachment by the saline waters of the Gulf, and in worse-case scenario, could stop sufficient flow of fresh water to the springs and make them too brackish to support the fresh water species (bass, sunfish, apple snail, aquatic plants, terrestrial fresh water habitats, etc.) presently living there, and too cold to provide life-saving thermal refuge to endangered Manatees during winter months.

FFWCC Peer review of the proposed Minimum Flows and Levels warned that the proposed reductions of fresh water flow could lead to "extirpation" of saline intolerant species. Residents and biologists familiar with the Chassahowitzka and Homosassa Rivers have observed declines in water quality, die-off of salt intolerant fresh water plants, and a movement of saline-influenced habitats farther up stream towards the springs. It is essential that you deny further reductions in flow, and make every effort to preserve the existing fresh water flow, and if possible, restore spring quality to that which would insure continued survival of the freshwater dependent habitats and species.

Rare and imperiled species of plants and animals (from Old Growth Cypress and terrestrial orchids to southeastern fresh water mussels, Chassahowitzka Black Bears, Whooping Cranes, Wood Storks, Manatees, and others) rely on the spring runs and associated fresh water habitats of the Chassahowitzka-Homosassa Riverine Swamp Sanctuary and forested wetlands for their continued survival.

The Chassahowitzka and Homosassa spring-fed fresh water ecosystems are too precious to degrade any further, or risk "extirpating" forever by increased salt water intrusion.
