The Southwest Florida Water Management District (District) does not discriminate on the basis of disability. This nondiscrimination policy involves every aspect of the District's functions, including access to and participation in the District's programs and activities. Anyone requiring reasonable accommodation as provided for in the Americans with Disabilities Act should contact the District's Human Resources Director, 2379 Broad Street, Brooksville, Florida 34604-6899; telephone (352) 796-7211, ext. 4702 or 1-800-423-1476 (FL only), ext. 4702; TDD (FL only) 1-800-231-6103; or email to ADACoordinator@swfwmd.state.fl.us.

These data were collected for specific permits by the District from various sources and methods over many years. The data obtained from the Southwest Florida Water Management District's Databases may be provisional and thus subject to revision. The District does not warrant, guarantee, or make any representations regarding the use, or the results of the use, of the data in terms of correctness, accuracy, reliability, completeness, usefulness, timeliness or otherwise and the District specifically disclaims any warranty, either expressed or implied, including but not limited to the implied warranties of merchantability and fitness for a particular use. The data is provided "as is" and the entire risk as to quality and performance is with the user. In no event will the District be liable for any direct, indirect, incidental, special, consequential, or other damages, including loss of profit, arising out of the use of these data even if the District has been advised of the possibility of such damages. All data are intended for resource project's and other District Department's use. These data do not represent an endorsement or recommendation. If you have any questions concerning these data, contact the Water Resources Bureau at (352) 796-7211 or 1-800-423-1476 (Florida).

2010 Estimated Water Use

EXECUTIVE SUMMARY

There were 8,228 water use permits (WUPs) issued in 2010 for 1,897 million gallons per day (mgd) on an annual average basis in the Southwest Florida Water Management District (District). Under the authority of these WUPs, it is estimated that 1,090 mgd were withdrawn. Figure 1 shows the District area of responsibility and all of the WUPs issued under its authority in red. Including an estimate for domestic self-supply (68 mgd), the total amount of water withdrawn from the surface water and groundwater resources in the District was 1,158 mgd.

The Estimated Water Use (EWU) Report summarizes and analyzes the withdrawal and use of regulated groundwater and surface water from natural surface water bodies in the District. The EWU report is generally used as a data source for a variety of water supply planning and management purposes.

Total regulated water withdrawal and use during calendar year 2010 are summarized, as well as total water use in six specific water use categories:

- Public Supply
- Recreation/Aesthetic
- Agricultural
- Mining/Dewatering
- Industrial/Commercial
- Domestic Self-Supply*

* Domestic self-supply is not regulated by the District, and the data used is obtained from sources outside of the District.

The water quantity data in the EWU is derived from metered withdrawal points and from estimates made on non-metered withdrawal points. The provenance of the data will be clearly differentiated throughout the report.

PUBLIC SUPPLY

This use category includes public water systems as well as privately held water utilities and entities that provide potable water to persons other than household members. Water quantities supplied for lawn and landscape

irrigation from a source separate from those used to provide customers with potable water are included in the public supply category and included in the residential total uses. Public supply is shown as both water withdrawn per county and water used per county.

From the Public Supply Annual Report (PSAR) forms that were submitted by 149 public supply permittees, the total quantity withdrawn was 481 mgd. The District WMIS database shows 459 mgd were withdrawn during 2010 for these same 149 permits. After research, District staff reduced the total on the PSAR forms to 474 mgd. Using a combination of WMIS database and the PSAR forms, the total water withdrawn for public supply is 483 mgd. Using the WMIS database only, the total is 468 mgd. This is a 15 mgd discrepancy. The higher pumpage values seem to be more correct because more realistic per capita rates are calculated. There was some difficulty for self-reporting permittees being able to input their pumpage data to the WMIS database on the District website. The decision was made by the Resource Regulation Department to put compliance and enforcement activities on hold until the input program could be corrected. Some of the problems have been addressed, but other problems remain. There are some other reasons for the discrepancy, and these are explained in the section on public supply.

DOMESTIC SELF-SUPPLY

This use category assesses the estimated freshwater consumption from non-permitted individual wells that provide potable water for indoor and outdoor domestic use. The total estimated, unregulated, domestic use is 68 mgd.

RECREATION/AESTHETIC

This use category includes water used for self-supplied large-scale landscapes; neighborhood, theme and water parks; cemeteries; golf courses and attractions. Since the use is on-site, the withdrawal amount and the used amount are generally considered the same for each county. The total use (metered + estimated) is 61 mgd.

AGRICULTURE

This use category includes metered water use plus estimated water use by specific crop type

2010 Estimated Water Use

for the crops that are produced in large quantities in the District (citrus, nursery, strawberry, melons, sod, and tomatoes), crops that are new to this area (blueberry), as well as aquaculture and pasture irrigation. Other crops are grouped under “Vegetables,” “Field crops,” and “Other.” The identities of the crops in “Other” are shown in the footnotes for Table 4. The total use (metered + estimated) is 467 mgd.

MINING/DEWATERING

This use category examines the self-supplied water use in mining operations, itemized by the type of material being extracted. The total use (metered + estimated) is 27 mgd.

INDUSTRIAL/COMMERCIAL

This use category analyzes water use data by major industry types, including power generation, for those businesses and institutions that are self-supplied. The total use (metered + estimated) is 52 mgd.

DATA SOURCES

The primary source of data for this report are unpublished, self-reported, monthly meter readings from permittees required to install meters on their withdrawal points. The meter readings are mathematically converted to pumpage in gallons per month. Additional data sources include, but are not limited to, the PSAR and population studies from the University of Florida’s Bureau of Economic and Business Research (BEBR).

The District does not regulate domestic self-supplied use. If a withdrawal point is for domestic self-supply use, the usual thresholds of well diameter and surface water withdrawal pipe diameter do not apply. However, an estimate of the amount of domestic self-supplied water withdrawn and used is included when discussion is for total water quantities withdrawn and used for potable supply. It will be indicated whether or not domestic self-supply is included in the tables.

In 2010, the population within the District was estimated to be 4.7 million people. An estimated 1,135 million gallons were withdrawn from the groundwater and surface water resources each day within the District. Approximately 89 percent of the estimated +

metered withdrawals were supplied from groundwater sources, assuming domestic self-supply is all from groundwater.

The following table shows the 2010 District-regulated water withdrawals. The largest water withdrawals were for public supply water users for 44% of the total use in the District. The second largest water withdrawals were for agricultural water use for 43% of the total District water use.

	AG	I/C	M/D	PS	R/A	TOTAL
mgd	467	52	27	483	61	1,090
Portion of Total	43%	5%	2%	44%	6%	100%

(excludes domestic self-supply)

The following table shows withdrawal quantities in the county in which they occurred.

Withdrawal Quantities by County (including domestic self-supply)

	<u>mgd/Yr</u>	<u>% of Total</u>
Charlotte *	21	2
Citrus	34	3
DeSoto	101	9
Hardee	51	4
Hernando	39	3
Highlands *	62	5
Hillsborough	259	22

Marion *	26	2
Pasco	96	8
Pinellas	21	2
Polk *	238	21
Sarasota	31	3
Sumter	35	3
District	1,158	100

* Data is only provided for the portion of the county within the District.

CHANGES FOR THE 2010 ESTIMATED WATER USE REPORT

Some changes were made to the accounting of water use in the District for the 2010 EWU

2010 Estimated Water Use

Report with respect to previous reports. The goal is to improve the tally of actual water quantities withdrawn from the resources.

Augmentation Quantities Included: The two most significant changes concern the type of pumpage data to include. For this report, withdrawals from groundwater that are pumped into lined and/or unlined ponds from which the groundwater is then re-pumped to the use is included. These withdrawals are defined internally as augmentation quantities and are always associated with a repump surface water withdrawal facility. The repumped quantity was not included previously either. Since the groundwater is withdrawn and used, it should be included. There were 28 mgd of groundwater pumped into ponds before being pumped to the use. Most of these augmentation and re-pump facilities are used in the recreation/aesthetic use category (20 mgd).

Alternative Water Supply Sources: The other pumpage tally change is that withdrawal points for alternative water supply (AWS) sources are not included as surface water withdrawals for this report as they were previously. These are predominantly reclaimed water withdrawals, but also are AWS quantities received from suppliers other than wastewater treatment plants. Withdrawals from containments that were constructed to capture excess stormwater is an AWS type that was included and will continue to be included.

For the 2010 EWU Report, withdrawals are shown in the county in which they occurred. This primarily affects the large regional water supply utilities where the water use is in a different county than the county where the withdrawals occurred. Withdrawals under the Tampa Bay Consolidated Permit (WUP No. 20011771) are attributed to Hillsborough, Pasco and Pinellas counties. Table A-3 shows the larger transfers of water between public supply Permittees. Table 9 shows the public supply quantities withdrawn by county as well as used by county. The differences in quantities have to do with imports and exports among the various permittees as well as treatment and transmission losses. Also, the withdrawal quantities under Mosaic Fertilizer WUP No.

20011400 are shown in the county where they occur.

Currently, groundwater withdrawals for environmental augmentation to mitigate impacts caused by pumping are not included. When environmental augmentation should be included is when the water does not cycle back to the aquifer from which it was just withdrawn. District staff will have to research each case of environmental augmentation to determine if the water recycles back to the aquifer or is removed from the aquifer. The latter will be included in this report in the future.

Other changes for the 2010 EWU Report are given in the Introduction.

METERED WITHDRAWALS

In 2010, 78% of the total regulated water withdrawals were from metered permits, and 22% of the withdrawals were made under unmetered permits.

Metered and Estimated Water Withdrawals (mgd), 2010

<u>Status</u>	<u>Quantity</u>	<u>Percent</u>
Metered	887	78
Estimated	183	22
Total	1,090	100

The following tables give a break-down of metered versus unmetered withdrawals for the two highest withdrawals.

Metered and Estimated Agricultural Water Withdrawals (mgd), 2010

<u>Status</u>	<u>Quantity</u>	<u>Percent</u>
Reported	304	65
Estimated	163	35
Total	467	100

2010 Estimated Water Use

Metered and Estimated Permitted Public Supply Water Withdrawals (mgd), 2010

2010 Estimated Water Use

INTRODUCTION

The District is one of five regional agencies charged with managing water resources in the state of Florida. Jurisdictional boundaries for the five water management districts are mostly based on hydrologic features, such as watershed drainage basins that frequently do not coincide with municipal boundaries. The District encompasses all or part of the following sixteen (16) counties: Charlotte, Citrus, DeSoto, Hardee, Hernando, Highlands, Hillsborough, Lake, Levy, Marion, Manatee, Pasco, Pinellas, Polk, Sarasota and Sumter.

Figure 2 shows 16 full and partial counties that are within the District's jurisdiction and the boundaries of two of three water Use Caution Areas (WUCAs) in the District: the Southern Water Use Caution Area (SWUCA) and the Northern Tampa Bay Water Use Caution Area (NTB WUCA). Note, the Most Impacted Area (MIA) is a special portion of the SWUCA and not a WUCA itself. Water use permits within the WUCAs have additional monitoring and reporting requirements associated with them.

The WUCAs were established because over reliance on the groundwater resource contributed to sea water encroachment into the aquifers from the Gulf of Mexico and to depressed aquifer levels that adversely impacted lakes and wetlands. As a result, the District's Governing Board determined that recovery strategies were needed to address the resource impacts. These strategies include enhanced regulatory requirements and other management tools to help address the impacts.

The NTB WUCA and portions of the SWUCA were established in the late 1980s and early 1990s, respectively. The SWUCA was expanded in 2003 to include all of the southern groundwater basin. In 2007, the NTB WUCA was expanded to include all of Pasco County and all of Hillsborough County that was not in the SWUCA. A third WUCA, the Dover/Plant City WUCA did not exist in 2010, so although it exists at the time of this writing, it is not included in this report. It will be included in the 2011 EWU Report.

WATER USE CATEGORIES

The District categorizes the use of water into five broad "predominant use" categories: agriculture, industrial/ commercial, mining/dewatering, public supply, and recreation/aesthetic. This report includes a section on domestic self-supply even though this is not a regulated water use. For all use categories except public supply, water use in this report is equivalent to water withdrawn or pumped from surface water and/or groundwater sources. For public supply, the actual water use in a service area is different from the amount of water withdrawn or pumped because of imports and exports to and from other utilities, including those outside of the District. Other factors, such as water treatment losses, and transmission losses between utilities accounted for some of the differences between public supply quantities withdrawn and used.

For the most part, District records for public supply pumpage were utilized in public supply calculations; however, the import, export, treatment losses, and deductions allowed under Chapter 40D-2, Florida Administrative Code (F.A.C.), were taken from the PSAR forms that the larger utilities submit. As will be explained later in the public supply section, the pumpage records in the District database do not always match the pumpage provided by the permittees on the PSAR forms.

In order to tally specific water use data, the WUP database in the Water Management Information System, known as WMIS, was queried for permitted WUP totals, withdrawal point totals and use category totals as well as for pumpage quantities by withdrawal point. The process of analyzing pumpage data has to normalize permitted withdrawal point totals with each WUP total, and compare the normalized withdrawal point totals with use category totals to develop use category fractions that are applied to actual pumpage. The resulting use-pumpage numbers are then tallied by source type, by month, by county, and by water use caution areas.

2010 Estimated Water Use

Most WUPs have many detailed uses catalogued. The detailed uses are grouped into the five predominant use categories mentioned earlier. The predominant use category having the highest quantity of water permitted is the predominant use of the permit. Generally, this is also how the quantities are described in this report. However, if a withdrawal point on the permit is specifically labeled for a different predominant use, in this report the permitted and pumped totals for it are put into the “different” predominant use.

As mentioned above, the five predominant use categories have many detailed uses. This report assigns the detailed uses into groups based on general similarities to provide permitted and pumpage information in greater detail without becoming overly complicated. To illustrate, a WUP that is predominantly for agriculture use could be permitted for water to irrigate a mixture of crop types (for example, nursery, beans, commercial hay, broccoli and citrus), as well as for potable water provided to farm workers. The crops will be in the agriculture predominant use category, and the detailed use will show citrus and nursery in their own group, but the quantities for beans and commercial hay will be grouped into “Field Crops,” and the quantities for broccoli will be put in a general “Vegetables” group. The water permitted for potable water will be put into the public supply predominant use category. It is for this reason that the data contained within the summary tables of each chapter should be used with discretion. The water use by use groups presented in the report should be used only to roughly gauge specific water use activities.

MEASURING WATER USE

Total water use in the District is presented as “Metered + Estimated” or is in subtotals for groundwater versus surface water use. Unless otherwise indicated, data is reported as an annual average daily rate using the unit “million gallons per day” (mgd). For those counties which are only partially within District boundaries, (Charlotte, Highlands, Lake, Levy, Marion and Polk), the estimates include water

use data for only the portions of the counties within the District. When possible, the source of water is also identified to be groundwater or surface water.

APPENDICES

Five appendices are located at the back of this report. Appendix A contains detailed lists of all WUPs per predominant use type and gives either the metered pumpage or the estimated pumpage. A separate table is provided for each water use category. Appendix B shows the total (estimated plus metered) quantities from groundwater and surface water sources for the District as well as for the WUCAs. Appendix C identifies the total permitted quantities from surface water and groundwater by county for the District and the WUCAs. Appendix D contains historic water use for WUPs issued for one million gallons per day or more by predominant use category. In addition, a ten-year public supply per capita water use comparison is presented in Table D-6. Appendix E contains calculations for the uniform per capita report prepared for the Florida Department of Environmental Protection (FDEP).

Estimating water use in the District requires the compilation and refinement of unpublished data contained in the WMIS database. However, these records contain at least three significant limitations of possible interest to the reader.

- Entities using less than 100,000 gallons per day (gpd) from wells that are less than 6-inches in diameter and/or from surface water withdrawal points that are less than 4-inches in diameter are not required to have a WUP. In the MIA of the SWUCA, the threshold to require a WUP is when the withdrawal is from groundwater, and the cumulative outside diameter of the wells constructed after April 11, 1994 is greater than 6 inches at the surface. Data for small water users who are below thresholds for requiring a water use permit are not available.

2010 Estimated Water Use

- Not all Permittees are required to report meter readings or pumpage amounts as a condition of their permit. However, because in such cases, the District categorizes why the water is used, it is assumed that unmetered users use water in roughly the same proportion as metered users.
- Due to treatment losses, distribution losses, water transfers between public supply permits, and other losses incurred during the withdrawal, treatment and distribution of water in a large system, the amount and location of reported pumpage does not necessarily coincide with the amount and location of actual end use for the public supply category.

The WUP database in the WMIS is continuously updating in real time as new permits are issued, existing permits are modified, and permits expire. The data presented in this report reflects only a “snapshot” in time. For this report, the WUP database in WMIS was queried on January 3, 2011 for data that were present as of December 31, 2010.

Pumpage data is more easily isolated in time, so a final snapshot of the 2010 pumpage is taken only after as much as possible of the tardily submitted information is input, and District staff have been able to identify pumpage and meter reading problems that would give rise to errors in the tally. Whenever possible, the database is corrected for obvious errors; however, smaller errors in the data are not caught and can cumulatively cause a large error when data is amalgamated. When corrections cannot be made to the database in a timely manner, the corrections are input programmatically into the SAS program used to retrieve pumpage (explained later on page 8). This latter level of correction is changed each year as the database is corrected or as new problems are discovered. The District puts a great amount of energy into providing the best possible pumpage data for these reports.

HISTORIC ESTIMATED WATER USE REPORTS

The District has prepared water use estimate reports since 1982. Through 1986, the preparation of these reports was a cooperative effort between the District and U.S. Geological Survey (USGS). Beginning in 1987, the District published these reports on an annual or bi-annual basis. Prior to 1992, the EWU relied on non-documented data such as Benchmark Farms data extrapolated for WUPs for agriculture use, voluntary survey responses for public supply, BEBR population information for domestic use (this is still done because the District does not regulate this water use), and used only metered data for industrial use and power generation use. No estimates beyond these mentioned were made. The use categories were also different from those that have been used since 1992.

Prior to 1989, metering was required only on WUPs for 500,000 gpd or more quantities on an annual average basis. Between 1989 and 1992, metering was required on all WUPs for 100,000 gpd or more quantities on an annual average basis in the Northern Tampa Bay WUCA, Eastern Tampa Bay WUCA and Highlands Ridge WUCA. By January 1992 all that were required to be metered were metered (under a meter cost reimbursement program by the District). In 2003, the SWUCA was established, replacing the Eastern Tampa Bay WUCA and the Highlands Ridge WUCA and including the counties between those two former WUCAs. Metering requirements were added to WUPs for 100,000 gpd or more on an annual average basis in the new area added to the SWUCA. Permittees began installing these meters (under another meter cost reimbursement program) beginning in 1995. By 2003 all permits in the SWUCA that were required to be metered were metered. In 2007, the NTB WUCA was expanded to include all of Pasco County and all of Hillsborough County that was not in the SWUCA. Metering conditions were applied to all WUPs for 100,000 gpd or more on an annual average basis under another meter cost reimbursement program by the District.

Since the 1991-1992 EWU reports, non-metered water use was estimated for permits

2010 Estimated Water Use

that did not have a condition to require the permittee to submit pumpage information. The estimate was based on similarity between metered users and non-metered users except for agriculture.

In 1994, instead of using an indirect method (acreage multiplied by crop water use coefficients) to estimate agriculture water use as in previous years, agriculture water use estimates rely on the same methodology as all other categories of use.

ESTIMATION PROCESS

The estimation process is briefly described below. In order to account for pumpage of non-reporting permits, a methodology was developed based on the assumption that all permittees of a specific use type will use a proportionally similar amount of water. Those that are not metered are assumed to use their permitted quantities in a manner consistent with permittees of like kind that do submit pumpage data.

For each predominant use category, pumpage of non-metered permits is estimated based upon the ratio of actual pumpage quantities to permitted quantities calculated for permits that reported pumpage quantities. Reporting permits were divided into five “tiers” based on permitted quantity and each tier is separated into the five predominant use categories. A ratio was derived for each size-use type combination. The water use type category, size of permit, and season of usage (for irrigation permits) determine which ratio is applied to non-metered permits.

Some WUPs that are required to be metered include withdrawal points that are not required to be metered. Generally these are withdrawal points permitted for less than 10,000 gpd. The use from these smaller withdrawal points is not estimated.

Readers of this report should be aware that many factors affect water usage including, but not limited to, weather, soils, economic conditions, water conservation activities, and the use of alternative water sources.

The provenance of the data used in the tables and figures is shown for every table and figure. Throughout the report, numbers have been rounded to the nearest thousand gallons per day, unless otherwise noted. As is appropriate, rounding is done at the last stage of analysis, so as the raw data are used in different ways, discrepancies due to rounding are apparent. Also, the totals shown may be slightly different from manual calculations performed by the reader. The detailed procedure is described in the 1994 *Estimated Water Use* report.

CHANGES FOR THE 2010 ESTIMATED WATER USE

The 2010 EWU introduces some changes to the type of pumpage, type of withdrawal point, and type of use that is included.

- Pumpage is separated into different reporting categories solely for internal District accounting. Prior EWU reports only captured pumpage from the resource that was immediately put to its use. Pumpage in the 2010 EWU includes pumpage from the resource that was put into a holding facility (usually a pond) before being repumped to the use. The repumped water was not included previously either, and is not included now. Adding these quantities to the tally added 28 mgd to the total quantity withdrawn. Most of this was added to the recreation/aesthetic use category (20 mgd).
- Withdrawals from surface water bodies do not include withdrawals of reclaimed water or other type of alternative water source (AWS), except those that are withdrawing captured excess stormwater. All types of AWS were included previously.
- Estimates for pumpage quantities are done on fewer withdrawal points on unmetered WUPs. The 2010 EWU excludes the withdrawal points from the estimation process that are designated:
 - “to be capped”
 - “to be dismantled”
 - “to be plugged”

2010 Estimated Water Use

- “repump”
- “rotational”
- “dewatering quantities that are recirculated”
- “closed loop heating or cooling”
- “tail-water recovery.”

All of these designations indicate either the intention to shortly discontinue use, recycling and re-pumping of water, or water that is not consumptively used. Previously all withdrawal points on such WUPs were included in the estimation.

- County designation: Previously the county indicated was the first county listed in the database. Originally this was valid as the county with the highest withdrawal rate was listed first. Over the years, the counties became listed alphabetically. A new SAS program for the EWU 2010 report calculates pumpage for WUPs that are in more than one county by the location of the withdrawal and assigns the total use for the WUP to the county having the highest withdrawal rate. The only exceptions are the Tampa Bay Water Consolidated Permit (20011771) and the large Mosaic water use permit (20010440). Another SAS program divides the actual pumpage for these WUPs according to the location of the withdrawal points.
- Previously the terms “Estimated Water Use” and “Estimated Pumpage” were used to describe totals comprised of metered pumpage plus estimated pumpage. This report restricts “estimated pumpage” to only that which is truly estimated (not metered). The term “metered pumpage” includes totals derived from meter readings and totals derived from digital direct recording mechanisms. The tables that combine metered pumpage and estimated pumpage are labeled “Metered + Estimated.”

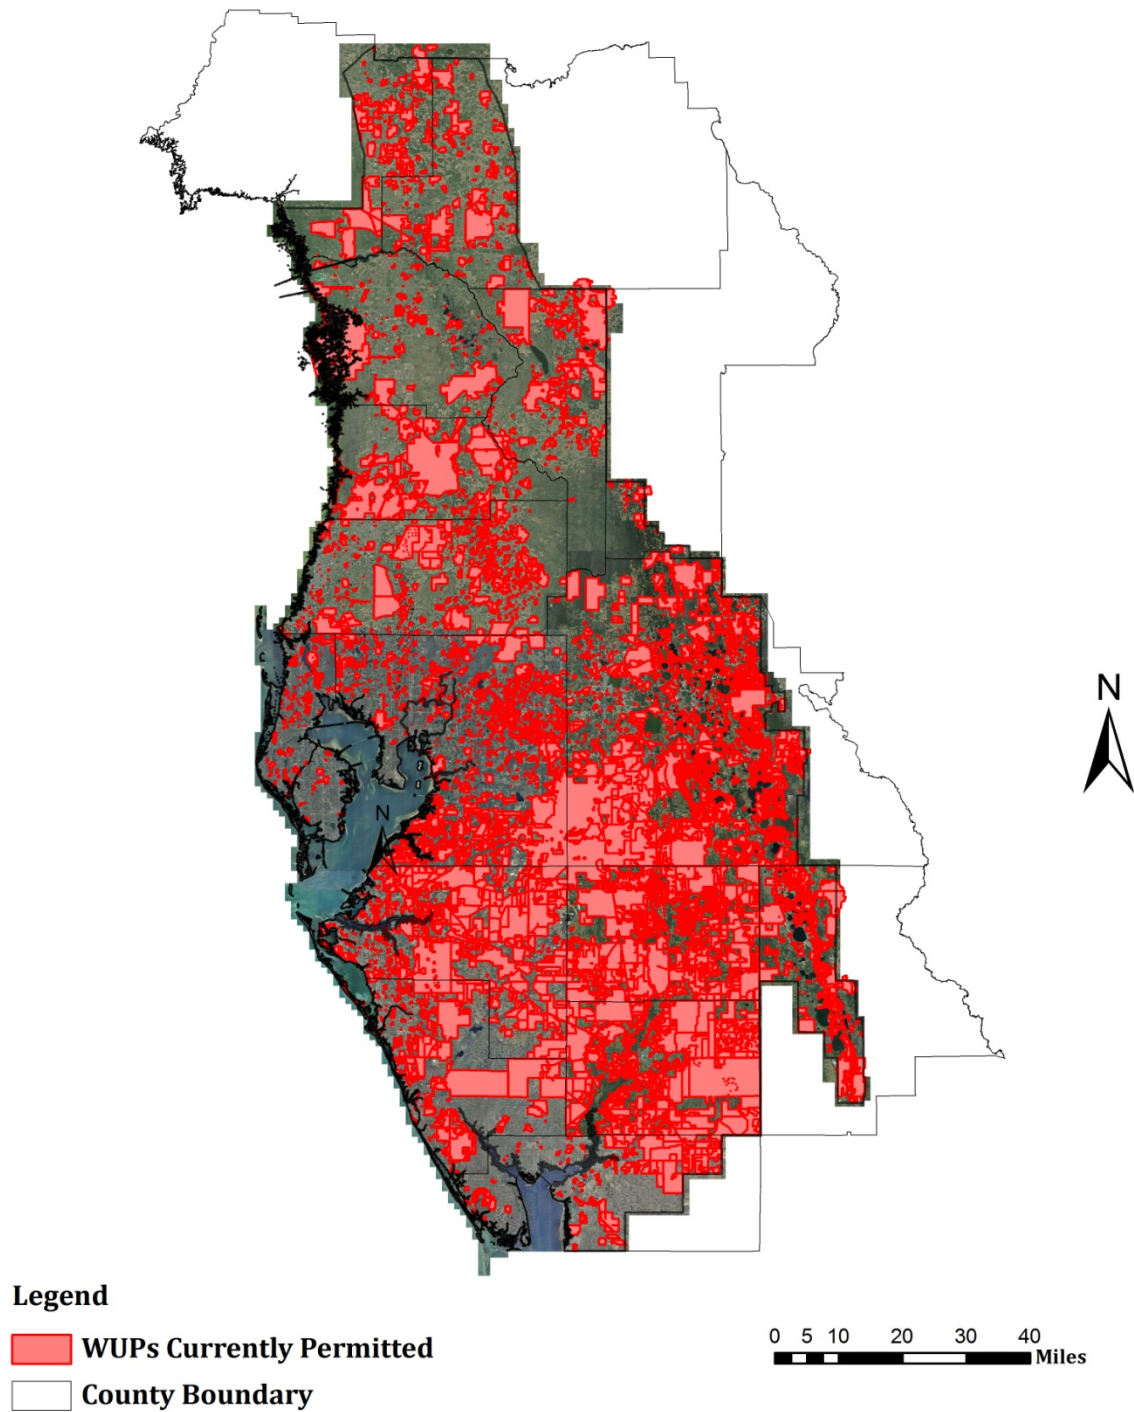

Public supply metered pumpage used in this report is derived from the Public Supply Annual Reports (PSAR data) and from the WUP database (WMIS database). There is a discrepancy between the amount of water indicated as pumped on the PSAR forms and the amount indicated as pumped on these same WUPs in the District WMIS database. The WMIS database only shows the pumpage that was submitted to the District as meter readings or as direct pumpage downloads. Pumpage quantities from records kept internally by the larger public supply permittees are likely the pumpage reported on the PSAR forms. The PSAR total sometimes varies from what was submitted monthly to the District. When the pumpage indicated on the PSAR closely matched the WMIS data, the WMIS data was used. When the pumpage indicated on the PSAR was not close to the WMIS pumpage, the file of record was investigated by District staff. If errors were found in the WMIS database, they were corrected, and the new WMIS database value was used instead of the PSAR pumpage. However, if the reason for the pumpage discrepancy could not be determined, the PSAR pumpage was used if it was the higher of the two numbers.

The pumpage submitted on the PSAR forms for 2010 totaled to 481 mgd for 149 WUPs. The pumpage reported for the same 149 WUPs in the WMIS database totaled to 459 mgd. From staff research, the pumpage, as submitted on the PSAR forms was adjusted to 474 mgd. This is still a 15 mgd discrepancy; however, it is believed that the higher pumpage is more correct because it generates more realistic per capita rates. Using the WMIS database alone, 468 mgd were withdrawn for public supply. Using the combination of data sources, 483 mgd were withdrawn for public supply. A full explanation of the discrepancy is provided in the section on Public Supply.

PROVENANCE OF PUBLIC SUPPLY DATA

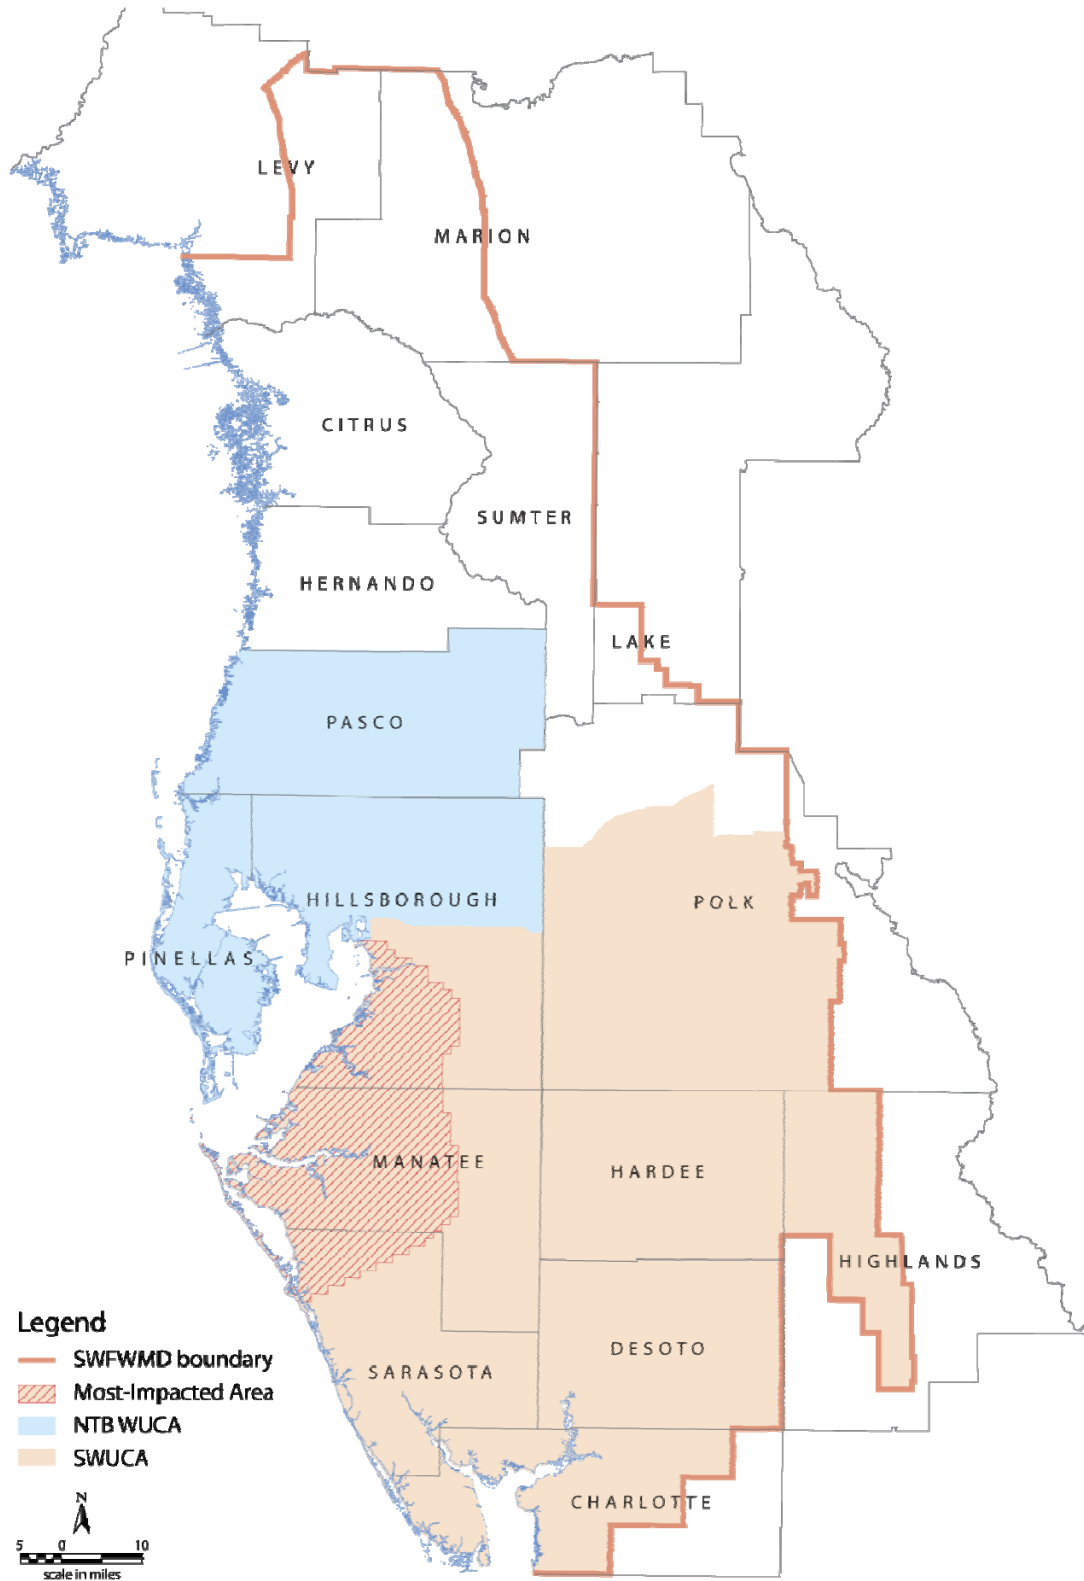

2010 Estimated Water Use

Figure 1. Water Use Permits in the Southwest Florida Water Management District

2010 Estimated Water Use

Figure 2. Southwest Florida Water Management District, Counties and Water Use Caution Areas

2010 Estimated Water Use

PUBLIC SUPPLY WATER USE = 459 MGD

The public supply water use category includes water quantities distributed by public water systems and private water utilities throughout the District as well as personal/sanitary water provided to employees, visitors and guests where the activity for which the permit was issued does not have a link to utility-provided water. It is also important to note that the public supply category may include fire suppression use, lawn and landscape irrigation, common area irrigation, and water supplied to businesses and commerce necessary to a gathered population. These nonresidential users are included in the public supply category because the water for these uses are supplied by a public supply utility.

For all use categories except public supply, water use in this report is synonymous with water withdrawn from surface water or groundwater sources. Treatment and distribution system losses, water lost during transfers from one public supply system to another, and water used for environmental mitigation are all accounted in the public supply category and create the difference between water withdrawn (pumpage) and water used (provided).

CAVEAT FOR PUBLIC SUPPLY DATA

As mentioned in the Introduction, two sources of data are used for the public supply predominant use category: the WMIS database and the PSAR forms. Tables A-1, A-2 and A-3 use data from the PSAR forms for the 149 public supply utilities that submitted the report. There is a 15 mgd discrepancy between the pumpage submitted on the PSAR forms and that which is in the District database. There are several reasons for this:

- Some permits were legally issued by the end of 2010 but were not completed in the database as of the time of the snapshot for 2010. So they were not captured in the snapshot. However, these permittees submitted their PSAR forms, so are included in that data.

- Not all the pumpage that occurred was reported by the permittee. The District database on pumpage is only as good as the data that is submitted. Some public supply utilities reported much higher pumpage on their PSAR than is recorded in the database. Permittees that submit a lot of data have had problems with using the District website to input their data directly. They may even have thought that it went in correctly, but it did not. Because of this, the District chose to not pursue compliance and enforcement actions until the data portal performed correctly. Some of the problems have been corrected; however, some problems remain and are being actively addressed.
- Water quantities received by utilities in a regional water supply system do not match water pumped by the various sources due to water losses in transmission. In addition, it is difficult to account for water in regional systems because some of the water goes directly to a service area while some goes to the central supply treatment plant. Pumped quantities from a wellfield or surface water body are provided to other utilities that are not in the regional system when the receiving utility has a shortfall.
- Pumpage from Aquifer Storage and Recovery (ASR) systems is composed of surface water quantities that were withdrawn and stored in the aquifer during the previous year as well as those withdrawn and stored in the aquifer during the current year. Thus the quantity reported as withdrawn for a specific year may include totals withdrawn in the previous year.
- Permits that were being combined into other permits may have been missed because they may have expired "in the database" even though they were kept legally active via being named on an application in-house.

When there was a disparity between the pumpage amount given in the PSAR and the amount shown in the database as pumped, the

2010 Estimated Water Use

discrepancy was investigated and the amount that seemed to be more correct was used. In most instances, the pumpage data in the WMIS database was incomplete, so the higher pumpage that was submitted in the PSAR was used.

Submitted PSAR forms provide water quantities withdrawn as one lump sum. From this one number, a gross use quantity is derived by adding imports and subtracting exports and treatment losses. Population data is given as well as their accounting of quantities allowed to be deducted from the gross use quantity for the calculation of per capita water use rates. Deduction quantities were used if accompanying documentation supported their numbers. When a permittee who was required to submit a PSAR did not submit it, the pumpage information came from the District database and the population information was calculated using census data and an estimate of the dwelling units served. No deductions were given in these cases.

When total water withdrawal quantities and use is cited in this report for the public supply use category, the pumpage, as modified by the PSAR, is used. The public supply withdrawals per month and use per month, groundwater versus surface water use, and pumpage totals for the WUCAs use the WMIS database. As much of the database that could be corrected was corrected before the final SAS pumpage program was run. If it could not be corrected in the database, it was programmatically corrected in the EWU programs used to generate pumpage. The pumpage reported in the PSAR is just one lump sum for each permit and cannot be disaggregated for further analysis in the manner described in the Introduction.

2010 DATA

In 2010, approximately 483 mgd (478 mgd metered + 5 mgd estimated) were withdrawn from the resource under the authority of 514 WUPs for public supply use. Of this withdrawal quantity, 459 mgd of potable water were provided to approximately 4.7 million public supply customers in the District (see Table 1,

column 9; data is from PSAR forms and WMIS database).

Groundwater is the principal source of public supply water in the District, with most groundwater coming from the Upper Floridan aquifer. The surficial aquifer and intermediate aquifer system are groundwater sources in some southern counties, such as Sarasota and Charlotte counties, where the Upper Floridan aquifer is either not readily accessible or has poor water quality.

In 2010, approximately 292 mgd, or 65 percent, of the total public supply pumpage was pumped from groundwater sources (Table B-1, Public Supply), and the remaining 158 mgd came from withdrawals from surface water bodies (WMIS database). Five counties in the District depend significantly on surface water sources for public supply water use. The City of Punta Gorda in Charlotte County relies on the Shell Creek Reservoir. Portions of Charlotte, DeSoto and Sarasota counties receive surface water withdrawn from the Peace River. The Hillsborough River supplies water to the City of Tampa and to some parts of Hillsborough County. Tampa Bay Water stores and treats surface water from the Hillsborough and Alafia rivers and from the Tampa Bypass Canal for their member governments. Manatee County and the City of Bradenton rely almost completely on reservoirs known as Lake Manatee and Evers Lake respectively.

The majority of public supply permits identified in this report are required to regularly report water withdrawal quantities as a condition of their WUP, as specified in Chapter 40D-2 F.A.C. This reporting condition typically applies to systems with an annual average permitted withdrawal quantity of 100,000 gallons per day (gpd) or more or with a maximum withdrawal quantity of 1,000,000 gpd or more in any single day. However, if close supervision of withdrawals of water from the resource is necessary for a WUP to meet the criteria for its issuance, metering can be required for WUPs below these thresholds. Of the 459 mgd of regulated water provided to the population of the District, 454 mgd (99%) were metered and

2010 Estimated Water Use

reported as a condition of public supply WUPs (PSAR data and WMIS data), while an additional 5 mgd were estimated (Table 1, Column 6) for non-reporting public supply WUPs.

Table 1 shows that Hillsborough and Pinellas counties used the most water for public supply (approximately 109 mgd and 89 mgd, respectively). Table 1 also identifies total PSAR public supply water use throughout the District. The first two columns, "Gross Water Use" and "Service Area Population" are taken directly from Table A-1 (PSAR data), which individually lists public suppliers and their service population by county. When a permittee did not submit the PSAR, the pumpage from the WMIS database, and population information was calculated using census data and an estimate of the dwelling units served.

In addition to recording the water used by the public supply permittees that are required to submit pumpage and population information on the PSAR form, Table 1 provides data on the water withdrawn and used by public supply permittees who are metered but do not have to submit a PSAR as well as the estimated withdrawal and use for public supply on WUPs that do not have a metering requirement. An estimated population served by the latter two groups is also given. The population of the service areas of public supply permittees that are required to submit meter readings but not a PSAR was derived by multiplying the county average unadjusted gross per capita rate by the metered pumpage rate. An additional 38,811 persons were added to the population for these small metered WUPs. The same method was used for the population associated with public supply WUPs that are not metered. This calculation added 72,911 persons to the population.

ESTIMATED WATER USE FOR UNMETERED PUBLIC SUPPLY WUPs

The calculation of estimated public supply water use data was based on the assumption that permits not required to report pumpage use roughly the same percentage of their average daily permitted quantity as those

permits which are required to report pumpage. In other words, "reported as a percentage of permitted" coefficients were developed, and then these coefficients were applied to the average daily permitted quantities of those public supply permits which are not required to report pumpage. The quantities permitted on both types of permits (metered and unmetered) was also a consideration.

In 2010, the estimated public supply water use was approximately 5 mgd. Polk County has the highest estimated public supply withdrawals at approximately 1.2 mgd, and Hillsborough County has the second highest estimated public supply withdrawals at 1.0 mgd.

It is important to note that some residential customers receiving water from a public supplier may have a well for landscape irrigation purposes only. It is difficult to estimate how much water is used in this manner. Those withdrawals are not included or estimated in these reports.

METERED SMALL PUBLIC SUPPLY WUPs

Public supply WUPs for 100,000 gpd or more on an annual average basis account for more than 99 percent of the total water supplied by permittees having WUPs for public supply use in the District. The remaining group of "Small General" public supply permits (those permitted for less than 100,000 gpd) that reported pumpage to the District are listed separately in Table A-1. In addition, permits granted for other uses (such as agricultural irrigation or recreation/aesthetic use) may have a component of personal/sanitary water that is provided to employees and guests. This group of "Small General" Public supply permits and personal/sanitary providers are accounted for in Table 1 under the column "Non-Survey Metered Water Use". During 2010, the additional metered public supply water use was approximately 3.7 mgd. In this category, Pasco and Hillsborough counties show the largest use with approximately 1.7 mgd and 0.8 mgd respectively. The population associated with these WUPs was calculated by multiplying their withdrawal quantities by the county average

2010 Estimated Water Use

unadjusted gross per capita rate calculated from the PSAR forms.

TOTAL PUBLIC SUPPLY WATER USE

As shown in Table 1, the total quantity of water used by approximately 4.7 million people in 2010 was estimated to be 459 mgd. A comparison of county-level public supply water use is illustrated in Figure 4. Figure 5 compares monthly estimated public supply water use as mgd/month and total area rainfall in inches per month.

Compared to other counties, Hillsborough County was the largest user of water for public supply purposes during 2010, consuming approximately 24% (109 mgd) of total public supply use. Pinellas County was the second largest water user, consuming 19% (89 mgd), and Polk County was the third largest water user, consuming 14% (65 mgd) for its public supply water use (Table 1).

FUNCTIONAL POPULATION

Although 2010 was a census year, block-level census data did not become available until the summer of 2011. Consequently, 2010 population served estimates are based on ratios developed from 2000 census information applied to 2010 dwelling units served. Further, the population numbers are adjusted for seasonal residency, tourists, and commuters coming into the service area for the day. This yields a “functional” population, which is the population given in this report when the permittee made the seasonal, tourist, and/or commuter calculations and submitted supporting documentation.

GROSS USE

Table A-1 lists the amount of raw water withdrawn, functional population served and the general water sources (groundwater or surface water or both) for each permit. It also provides permit-specific details about water transfers, both imports and exports. Losses associated with desalination water treatment (typically reverse osmosis (RO) or electro-dialysis reversal (EDR)) and some conventional treatment processes (such as flocculating suspended solids and filter backwashing) are

also shown. The finished water actually made available for use by customers is the “Gross Use” column. There are 161 utilities that have a gross use quantity. Fourteen public supply permits show zero gross use because they only export to other service areas. Other WUPs, although permitted, are not yet active.

Please note if a permit serves a population in more than one county, or if its use occurs in a county other than the county of withdrawal, it is possible for the same permit number to occur in more than one county within this table. Total gross use was in 2010 was 459 mgd

PER CAPITA

Per Capita is a measure of the amount of water used by a population. The District uses three measures of per capita: unadjusted gross, adjusted gross, and compliance. These per capita types are shown in Table A-1 of Appendix A for the larger utilities and a brief explanation of each is provided in this section. For a more complete explanation, the reader can access the Water Use Permit Information Manual, Part B, Basis of Review that is adopted under Rule 40D-2.019, F.A.C., at the District website.

CONSERVATION RULES MORE WIDELY APPLIED

Conservation rules that had been in effect for the SWUCA and the NTB WUCA since 2003 were expanded District-wide in January 2009.

The expanded conservation rules require all public supply permittees having a permit for withdrawal quantities of 100,000 gpd or more on an annual average basis to complete an annual survey beginning with the calendar year 2011. Calendar year 2010 is the last year that this requirement is limited to permits in the WUCAs. However, many public supply permittees submitted the PSAR forms voluntarily. The PSAR form provides a format for information such as service area population, water losses associated with treatment, permit-to-permit transfers, and system-level water use demand data. With this information, the actual water use by the public supply system was estimated and expressed as per capita water use. Table A-1 is a summary of this data.

2010 Estimated Water Use

The required per capita for all public supply permittees to attain was set to 150 gpd, and this rate has to be achieved by December 31, 2019. Those public supply permittees that have a five year average (2005-2009) compliance per capita rate (explained below) above 150 gpd/person limit must be at least half of the way to this goal by December 31, 2014.

UNADJUSTED GROSS PER CAPITA

Dividing the gross use by the functional population gives an Unadjusted Gross Per Capita (UGPC) rate. The District average UGPC rate was 98 gpd in 2010 as calculated from the PSAR forms using 162 permits associated with a service area population. There are 82 permits (51%) that have a UGPS rate greater than this average and 80 utilities (49%) with an UGPC rate less than this average. The permittees with lower UGPC rates are predominantly located in counties in the southern portion of the District that has had more stringent conservation rules since 1990. The counties in the northern portion of the District only received the stricter conservation requirements in 2009, and they were effective January 1, 2011.

Only 24 permits have a UGPC rate greater than the rule-required 150 gpd per capita rate. The others are considered to have met the 2019 per capita limit (provided they stay below 150 gpd/person).

High per capita water use is more common in master-metered communities. People who are not held accountable and charged for the amount of water they use do not have an economic incentive to be efficient. Residential developments with large lots sizes have larger lawns and tend to have higher per capita water use rates. New residential developments with a high number of new lawns also tend to have high per capita water use rates as homeowners "water-in" the new lawns. Communities that have less than the District average number of persons per dwelling unit also will show a higher unadjusted per capita rate. If the permittee can support the data, an adjustment can be made to account for the low persons per household effect on per capita rate calculations.

A low unadjusted gross per capita water use rate is more common in communities with high water prices and for permittees using the "dwelling unit" population estimation method. This method takes the number of dwelling units in a utility's service area and multiplies that number by an average number of people per household. This method incorrectly assumes that all dwelling units are occupied year around and gives an unrealistically low per capita value because it also does not adequately correct for a seasonal residential, tourist and commuter populations.

The accuracy of per capita water use rate data is highly dependent on the quality of population information used in the calculation. A population that is adjusted to be a functional population yields not only a lower per capita rate, but it yields a more accurate one. In the past, per capita calculations could also have been affected by population data that is skewed by double reporting of population in overlapping public supply service areas. However, the District now has fully digitized service area information in its GIS database, and no overlaps are allowed. All population data submitted is verified, and if the population submitted seems unduly large or small, District staff will adjust it using the methodology described on the District website.

ADJUSTED GROSS PER CAPITA

Unadjusted gross per capita rates are usually not directly comparable between utilities if one supplies a large amount of water to non-residential users, has an unexpected water loss (such as a major pipeline failure), or has access to reclaimed water (or other alternative water supply) to provide irrigation quantities associated with residential use, for common areas, and in parks, and the other does not. The current per capita system now takes most of these circumstances into consideration with the Adjusted Gross Per Capita (AGPC) rate. It does not adjust for the use of reclaimed water as an irrigation source within the service area.

Before the service area water use is divided by the functional population, deductions can be taken for non-resident-related water use to

2010 Estimated Water Use

calculate the AGPC. These are significant industrial/commercial use, District-required environmental mitigation, and separately accounted irrigation water provided to golf courses. Details of these deductions per public supply permit are shown in Table A-1 in Appendix A.

The industrial/commercial use deductions are referred to as "Significant Use". To qualify as a significant use, the amount delivered must meet certain criteria, and the permittee must submit documentation for the deduction claimed as well as providing a copy of the permittee's conservation plan for each significant user claimed. The Water Use Permit Information Manual, Part B, Basis of Review provides details about such criteria, documentation and water conservation plans. An environmental mitigation deduction can be taken if a permittee is required by the District to pump water to replenish lakes and wetlands that were impacted by their withdrawals.

AGPC rates allow for more equitable comparison of the utilities with respect to their population's water use habits. If the utility fails to qualify for significant use deductions (such as water provided to a power plant), claimed on the survey, Table A-1 will show a higher AGPC rate than the permittee claimed. Per the PSAR forms, as evaluated by District staff, the 2010 District average AGPC rate is 96 gpd. There are 76 WUPs (47%) with an AGPC rate less than the District average, and 86 WUPs (53%) with an AGPC rate greater than or equal to the District average. Only 18 permittees (11%) have an AGPC rate greater than 150 gpd.

COMPLIANCE PER CAPITA

The Compliance Per Capita (CPC) rate allows the public supply permittee to further reduce their per capita by deducting reclaimed water and storm water provided as alternative water sources to customers that are not included in their service area. These sources of water cannot have been used to reduce the public supply permittees' UGPC rate or AGPC rate. For instance, these deductions cannot be included in the CPC rate if they were deducted under the golf course irrigation deduction. The CPC rate

is the final per capita rate that can be used to meet compliance with the District per capita requirement in 2014 and 2019.

The overall CPC rate for the District is 92 gpd. There are 84 WUPs with a CPC rate above the District average and 78 WUPs with a CPC rate equal to or lower than the District average. Only 17 WUPs have a CPC rate greater than 150 gpd.

The District total withdrawal quantity for public supply (shown in Table A-1, page 11 of Appendix A) was 474 mgd in 2010 (PSAR forms). An additional 4 mgd was added via metered public supply use for 478 mgd withdrawn under metered WUPs. An additional 5 mgd was estimated for a total withdrawal amount of 483 mgd for public supply.

RESIDENTIAL PER CAPITA WATER USE

This per capita rate is not included in the regulations governing public supply use in the District. It is close to the adjusted gross per capita, except no documentation is required or given for deductions from the quantity of water withdrawn. It is supposed to represent just water used at a residence, whether that is a single family, multi-family or mobile home. It is based on the utility's billing detail.

PUBLIC SUPPLY WATER TRANSFERS

Geographic conditions and population growth differences necessitated inter-county and/or inter-permit water transfers in some parts of the District. Such transfers will play an increasingly important role as more emergency interconnect systems are constructed, existing regional water supply authorities develop additional wholesale arrangements with member systems, and new regional water supply systems are developed to meet the growing demand for potable water in the District.

Table A-3 in Appendix A provides some detail of permit-to-permit water transfers. In the District, approximately 229 mgd were exchanged among water use permittees in 2010.

MONTHLY WATER WITHDRAWALS

2010 Estimated Water Use

Because of the discrepancy in pumpage quantities reported on the PSAR and in the database, the monthly withdrawal data uses the District database as the data source. Monthly withdrawals reported for public supply in the District are shown in Table A-4 in Appendix A as well as in Figure 4 in this chapter.

UNIFORM PER CAPITA RATE

In response to concerns that Florida's five water management districts were using different methods to calculate public supply water use and per capita rates, the FDEP developed a uniform statewide convention for the calculation of public supply water use in 2009. The document entitled, "Guidance on Per Capita Water Use: Uniform Definition and Performance Measures," March 3, 2009, was developed by staff members of each water management district and staff of the FDEP. The District began reporting this information using the methods prescribed in the guidance document to the FDEP in 2007, beginning with the 2006 calendar year. This uniform per capita data is only used for comparison purposes by the FDEP and are not used for sources in planning or demand projections.

The uniform per capita rate is calculated as follows:

(Withdrawals + Imports - Exports - Treatment Losses) / Residential Population Served, where "Residential Population Served" is equal to Housing Units Served by the Utility times the Average Persons Per Household within the Utility

Appendix E shows the per capita values used in the 2010 FDEP Uniform Per Capita Report.

(WMIS database)

2010 Estimated Water Use

DOMESTIC SELF-SUPPLY USE = 68 MGD

In 2010, approximately 68 mgd was used for domestic self-supply purposes within the District. Because the users included in this category are not required to have water use permits, the estimates are indirectly calculated based on available population estimates and conceptual water use data (Table 2).

GENERAL INFORMATION

The domestic self-supply category estimates the amount of potable water withdrawn from individual wells that serves a private residence made up of family members. These residential users are usually located in rural areas, but they can also be located in suburban or urban areas. It is generally true that the water is withdrawn from small diameter wells; however, any size well that is used only for domestic use is exempt from regulation. It is assumed that groundwater is the source of water for domestic self-supply.

2010 DATA

Domestic self-supply water use estimates are based on the population for a given county and is calculated as the difference between the county-level functional population and the total functional population served by regulated public supply utilities for the same county (Table 2, Column 1). The county functional population was taken from the Regional Water Supply Plan for 2010.

Assuming that self-supplied water users have the same water use habits and thus the same residential per capita water use as the people served by the public supply systems, the residential per capita data from Appendix A-2 is multiplied by the domestic self-supply population to derive estimated use.

Figure 5 shows the percentages of the total 68 mgd that are used in the counties. Polk County had the highest domestic self-supply use (18%), followed by Hillsborough (16%), and Pasco (15 %) counties.

Because domestic self-supply water use is estimated based on public supply data, it is

assumed that the monthly use pattern tracks that of public supply. Consequently, a separate monthly fluctuation chart is not included in this report.

2010 Estimated Water Use

(BEBR population and PSAR data)

2010 Estimated Water Use

RECREATION/AESTHETIC USE = 61 MGD

The recreation/aesthetic use category includes the irrigation of golf courses, cemeteries, parks, sport playing fields, and other large landscapes, as well as water park and theme park water demands. It does not include reclaimed water or other types of alternative water supply sources that are used for those same purposes.

Recreation/aesthetic uses are also on WUPs that are not predominantly for recreation/aesthetic purposes, such as being part of the water demand for a residential development that includes a golf course. As in all use categories, there are recreation/aesthetic water users that use withdrawal points below regulatory thresholds to require a WUP. These small water-users are not included in this report.

GENERAL INFORMATION

This report separates recreation/aesthetic use into large groups that consist of similar uses. Golf course irrigation and lawn/landscape irrigation are shown alone (Table 3). The District irrigation rate calculation program (AGMOD) is used to derive the acre-inch application rate for irrigation of golf courses, lawn & landscape, parks, cemeteries, and sports fields based on Blaney-Criddle calculations. AGMOD uses site-specific data for soil type, irrigation method, amount of solar radiation received on average, historic rainfall for the county, root depth and other factors that affect how much supplemental irrigation is required to meet the plant needs.

2010 DATA

Metered plus estimated recreation/aesthetic water use within the District is 61 mgd for 2010. Of this amount, approximately 55 mgd (90%) are withdrawn from groundwater sources, and the remaining 6 mgd are withdrawn from surface water sources. These totals are less than what was given for recreation/aesthetic use in the 2009 EWU Report. The reasons may be that the

estimated water use was over-estimated in 2009 because withdrawal points that were designated as alternative water supply (such as reclaimed water), re-pumped water, or some other duplicative use were included in the 2009 tally of water use. They are not included in this report. Also, water that was withdrawn from the resource and put into a pond, termed "augmentation", prior to being withdrawn again for irrigation is included in the 2010 EWU but were not included in the 2009 EWU (or any earlier EWU report). These augmentation quantities are 20 mgd for 2010, but are still less than the alternative water supply sources that were included previously.

Table 3 shows recreation/aesthetic use per county by group type and gives the District total. The highest water use in the recreation/aesthetic use category is irrigation of the tees, greens and fairways of golf courses. The actual playing area is measured in acres and irrigation quantities are applied separately from those for decorative lawns and landscape associated with golf courses. No irrigation quantity is given for roughs. The golf course is analyzed separately because the volume of foot traffic over the grass is considered by the District in the allotment of water for irrigation. Tees and greens receive 50 acre-inches of water per year because of the very short cut height and very high foot traffic. These types of impacts to turf grasses are taken into account in AGMOD for sports playing fields and parks as well.

Table 3 also provides county-level water use data for each use group within the recreation/aesthetic use category. The county with the highest recreation/aesthetic use is Hillsborough County (8.8 mgd) with Polk and Manatee counties following closely (8.7 mgd and 8.6 mgd respectively). Sarasota County came in fourth with 6.5 mgd used for recreation/aesthetic use. Figure 5 shows that these four counties account for 53% of the total recreation/aesthetic use in the District.

2010 Estimated Water Use

Figure 6 shows monthly rainfall and monthly pumpage for recreation/aesthetic use. As is expected, withdrawals for recreation/aesthetic use increases when the rainfall decreases because the highest water demand for recreation/aesthetic use is for irrigation, which is directly affected by rainfall.

As mentioned above, the largest water use within the recreation/aesthetic category is for irrigation of golf courses at 35 mgd or 58% of the total recreation/aesthetic use.

Lawn and landscape irrigation is the next highest use for 18 mgd or 30% of the water use.

Table A-5 in Appendix A provides detailed, permit-specific water use data per county for metered recreation/aesthetic WUPs. The table shows the WUP number, permittee name, average amount of water used per day, permitted use, withdrawal source (groundwater versus surface water), and how much of the permitted quantity is for recreation/aesthetic use.

Estimated monthly recreation/aesthetic water use at the county level can be obtained from Table A-6.

2010 Estimated Water Use

AGRICULTURE USE = 467 MGD

Total metered plus estimated agriculture water use in 2010 was estimated to be 467 mgd in the District. This use type category is for groundwater and surface water withdrawals related to agriculture activities. Reclaimed water is commonly utilized for irrigation of certain crops; however, this quantity is not included in this report.

GENERAL INFORMATION

Historically, agriculture water use estimates were calculated indirectly based on estimated production acreage and crop water use coefficients. However, since 1989 the District required all WUPs issued for 100,000 gpd or more on an annual average basis to be metered in the Eastern Tampa Bay (ETB) WUCA and Highlands Ridge (HR) WUCA (now part of the SWUCA) and since 1992 in the NTB WUCA. In 2003, all permits for 100,000 gpd or more on a drought annual average basis (2-in-10 statistical rainfall year) in the SWUCA were required to meter withdrawals. It wasn't until 2009 that the metering requirement threshold for WUPs issued for 100,000 gpd or more on an annual average basis was expanded to the entire District. In the SWUCA, the metering requirement is for WUPs issued for a drought annual average (DAA) quantity of 100,000 gpd or more. This quantity is based on a 2-in-10 rainfall year and is the same as the standard annual average quantity outside of the SWUCA. The reader is referred to Chapters 3 and 5 in the Water Use Permit Information Manual, Part B, Basis of Review for a more detailed explanation of rainfall frequency relative to permitted quantities and metering thresholds respectively.

To assist agricultural permittees with new metering requirements, the District reimbursed permittees for meters purchased as a result of the new rules.

2010 DATA

Currently 65% of the water used for agriculture operations is metered. This is up 4% from 2009. Those that are not metered fall below metering thresholds.

Monthly pumpage data is used to estimate probable pumpage for agriculture WUPs that are not metered. It is assumed that water users of the same type will have similar water use practices. The amount of estimated water used for agriculture use has appeared to decrease, but this may be due to the elimination of doubly-accounted water use, such as re-pumped water and alternative water supply sources from the previous tallies.

Reported/Estimated Agricultural Water Use (mgd), 2010		
Status	Quantity	Percent
Reported	304	65
Estimated	163	35
Total	467	100

The District irrigation rate calculation program (AGMOD) is used to derive the acre-inch application rate for 39 crop types based on Blaney-Criddle calculations that take rainfall, soil type, irrigation method, solar radiation, root depth, etc. into account.

Of the total 467 mgd agriculture water use volume, approximately 448 mgd or 96 percent was withdrawn from groundwater sources (Table B-1, Appendix B). Table 4 summarizes water use by county and crop type. Permit-specific water use data for all agriculture WUPs reporting pumpage and the estimated water use for unmetered WUPs are given Table A-7 in Appendix A.

Figure 8 gives the percentage agriculture use by county. The county with the greatest percentage of agriculture water use in 2010 was Polk County, using approximately 22 percent or 105 mgd. Citrus is the predominant crop in Polk County, accounting for 93 mgd (89%) of the water used for agriculture,

2010 Estimated Water Use

Table 4 provides information regarding water use per crop type and general crop groups by county. Citrus is still the biggest crop in the District, followed by tomatoes (mostly in Manatee County), strawberries (mostly in Hillsborough County), and general vegetables (mostly in Manatee County). Blueberries are a relatively new crop in Florida, and Polk County has taken the lead in that water use. Peaches are another new crop in this part of Florida; however, due to their novelty, they are not yet coded separately from general fruit trees.

The majority of agricultural activity takes place in the SWUCA, accounting for approximately 82% of the water used for agriculture (See Appendix B).

younger, more easily damaged and less salvageable if damaged. Table A-8 in Appendix A shows withdrawals by county by month. For more information regarding agriculture water withdrawal/use, please refer to Tables 4, 8, and 9, and to Tables A-7, A-8 and B-1 in the appendices of this report.

Agricultural Water Use (mgd), by Region

	SWUCA	NTB WUCA	Non-WUCA
MGD	382	43	42
%	82	9	9

Figure 9 shows the relationship between monthly rainfall and agricultural water use. As expected, the amount of water used for agricultural purposes is inversely proportional to the amount of rainfall. Rainfall data presented here is an area total for the entire District. Of note are the two high-use months of January and December in 2010. These two spikes in water use are the result of the use of water for cold protection. Strawberries and citrus are typically protected with water when the temperature approaches 34° F. The duration that withdrawal points are pumped for cold protection varies by location. The northern part of the District typically requires 24 hours of constant pumping for freeze protection, and the southern part requires 14 to 17 hours of constant pumping. In January 2010, there were six major freeze events, each lasting approximately 1 day in the SWUCA. In December 2010, there were two significant freeze events in the SWUCA, each lasting for several days. The December cold was earlier than normal, thus the strawberry plants were

2010 Estimated Water Use

MINING/DEWATERING USE = 27 MGD

In 2010, approximately 27 mgd of water was withdrawn from mining sites due to mining and dewatering activities in the District (Table 5). Nearly all of the water was withdrawn from groundwater sources with only 0.3 mgd withdrawn from surface water sources.

GENERAL INFORMATION

The mining/dewatering water use category includes phosphate, peat, limestone, and sand/shell/gravel mining as well as the creation of borrow pits for construction purposes. The permitted quantities on mining/dewatering WUPs issued by the District prior to 2000 were based on dewatering quantities regardless of whether the water was kept onsite or discharged offsite, as well as water used for processing the product, reclamation irrigation, landscape irrigation and personal/sanitary needs at the work site. On some WUPs, the permitted and pumpage quantities included water that was pumped from pond to pond. This water was recycled rather than consumed and is no longer included.

Since 2000, as mining/dewatering WUPs were renewed, only the water that was removed from the local hydrologic system was put on the WUP as a permitted quantity. These are dewatering quantities discharged off-site; water entrained with product; water used for washing and processing the product onsite; water used to move the product (slurry); reclamation irrigation; water used to internally produce the electric power needed by a mining operation (a process known as co-generation); and for gypsum stack closure as well as the ancillary withdrawals for personal/sanitary needs of employees; to maintain equipment and vehicles; landscape irrigation; and fire suppression and testing. These are also the quantities that are monitored and indicated as withdrawn in the mining/dewatering use category, with the exception of water entrained with the product.

The reason for this change was because when water is pumped out of an active mine pit into a nearby pond or surface water body, it will quickly return to the mine pit and be pumped repeatedly when there is a strong underground hydraulic

connection between the withdrawal point and receiving area. When hydrogeologic information indicates this is happening, the District categorizes that as dewatering that does not add to consumptive loss. This is common in south-central Florida. Further, when the dewatering quantity is not related to potential withdrawal impacts, the dewatering pump is not required to be metered.

Most of the mining operations today re-circulate dewatering quantities onsite, and the product usually sits onsite to dewater prior to being taken offsite. The pumpage records will never show the actual amount of water entrained with the product because that is a calculation made per the product and mining operations.

A “sealing” water well is a well that withdraws water to transport mined products through pipelines as slurry. Water is introduced at various locations along the pipeline to keep the slurry moving. Sealing water wells are drilled as needed and then plugged when the pipeline is moved elsewhere. A quantity is permitted to these wells on the WUP even though the actual well equipment is frequently moved.

2010 DATA

For this report, the withdrawals on the large Mosaic Fertilizer LLC permit were apportioned to the counties (Manatee, Hillsborough and Hardee) in which they occurred. Table 5 summarizes county-level water use by product type. Figure 10 illustrates that in 2010, withdrawals for mining/dewatering use were greatest in Polk County by a large percentage. Polk, Hillsborough, Manatee and Hernando counties account for a combined total of approximately 24 mgd (98%) of water consumed in the mining/ dewatering category.

Mining/dewatering water use compared to rainfall is presented in Figure 11. There is a slight suggestion that mining /dewatering operations are inversely proportional to rainfall.

Table A-9 in Appendix A presents permit-specific water withdrawal data for mining/dewatering use, grouped by county. Table A-10 illustrates average monthly withdrawals by county and source.

2010 Estimated Water Use

INDUSTRIAL/COMMERCIAL USE = 52 MGD

Approximately 52 mgd were withdrawn from the groundwater and surface water resources for industrial/commercial water use in the District during 2010.

GENERAL INFORMATION

The industrial/commercial water use category includes product manufacturing, food processing, commercial and specialty businesses, water used in the drink industry (including bottled water), power plants, and water provided for institutional use (prisons, nursing homes, etc.). This category does not include water used for industrial/commercial customers of public supply systems. It also does not include seawater that is used for cooling power plants. "Product Manufacturing" has replaced the category "Chemical Manufacturing," found in previous reports.

2010 DATA

Most of the water used in the industrial/commercial use category is from groundwater as shown in the table below.

Industrial/Commercial Total Water Use (mgd), by Source		
	Groundwater	Surface Water
Quantity	49	3
Percent of Total	94%	6%

Table 6 presents county-level water use by industry groups. Because industrial/commercial enterprises are so varied, grouping them into succinct groups is difficult. "General Industrial/Commercial" is the largest group within the industrial/commercial use category (16 mgd) because it includes a large number of industrial/commercial uses, each of which is a small water use. These uses are water for air conditioners and chillers, boiler feed and makeup water (non-power plant), cleaning and maintenance, emission control, refrigeration, water well contracting, product dilution, lawn and landscape irrigation, equipment cooling, and heat exchangers, etc.

Phosphate processing is the largest single use in the industrial/commercial use category for 14

mgd or 28% of the industrial/commercial use. Phosphate processing that is done away from the mine site is classified as an industrial/commercial water use, while processing of mined materials that is done at the mine site is classified as mining/dewatering water use.

Product Manufacturing (11 mgd) includes asphalt manufacturing, bottled water (2 mgd), biofuel generation, cement manufacturing, cement or concrete batch plants, cement or concrete products, chemical manufacturing, lime processing for fertilizers and other general product manufacturing.

Power plant water use includes water used for steam cooling and once-through cooling (excluding seawater), emission control, boiler feed and makeup, personal/sanitary needs for visitors and employees, and other small uses related to a power plant. Power plant water use decreased from 23 mgd in 2009 to 7 mgd in 2010. Part of this may be due to the Crystal River nuclear power plant going off-line in Citrus County as well as other power plants combining operations and thereby decreasing water use. It was discovered that withdrawal quantities for two related power plants that shared withdrawal points were each counted, duplicating withdrawal quantities. The two power plants were combined into one WUP, and the historic data was corrected in 2010.

Polk County also uses the most water for food processing and packing. This is predominantly used for citrus processing and packing.

Figure 12 illustrates that in 2010, Polk County had 60% of the industrial/commercial use for 31 mgd. Much of this is associated with phosphate processing. Hillsborough County used 6.6 mgd, which is 17% of water withdrawn for industrial/commercial use. This is expected because of the large number of businesses in the greater Tampa Bay area. Figure 13 shows that there is only a limited relationship between industrial/commercial water use and rainfall.

Appendix A includes Tables A-11, which shows industrial/commercial water use by permittee; and A-12, which summarizes total (estimated + metered) monthly industrial/commercial water use.

(WMIS database)

Figure 13. Metered + Estimated Industrial/Commercial Water Use (mgd/month) and District Regional Total Rainfall (inches/month), 2010

(WMIS database)

2010 Estimated Water Use

TOTAL WATER USE = 1,135 MGD

The majority of data found in this report was extracted from the WUP database in the District Water Management Information System (WMIS). To provide some insights into the District WUP database, 1,801 permittees reported monthly water use from 6,839 withdrawal points to the District in 2010 (See Table 7). This is not very different from earlier years. Getting the pumpage data into the District database represented a substantial work effort on the part of District staff. So the District set up a data portal in their website to enable permittees to enter their own pumpage or meter readings directly into the database monthly. Permittees are encouraged to set up an account in WMIS with the District; however, this is not required because many permittees do not have computers, computers with enough memory to interact with the District website, or just prefer to send the data in on scanning sheets. Note, all scans from scanning sheets are proofed manually.

Being able to keep accurate records on water use is tremendously important to managing the limited water resources of the District so that water is shared fairly as well as insuring that withdrawals of water do not adversely impact existing legal users, the environment and the resource itself. It is also important that accurate records of pumpage are made for the permittee. Over-pumpage of the permitted quantity is a violation of the terms of the WUP, which is a legally binding document issued by the state. If such a violation occurs, it is very helpful to a permittee if he or she can demonstrate that the over-pumpage was a rare if not isolated occurrence. Chronic over-pumping does result in monetary fines.

2010 DATA

Table 7 shows that at the end of 2010, the District permitted 1,897 mgd on an annual average basis for use on 8,228 WUPs. Almost half (46%) of the permitted quantity is on only 22% of the WUPs issued.

Table 8 identifies metered versus estimated water use quantities by county and category of

use in the District. Excluding domestic self-supply, only 17% of the total water withdrawn was estimated. Metered WUPs are only 22% of the total number of WUPs, but they account for 83% of the water withdrawn in 2010.

Total water withdrawn in the District in 2010 was 1,158 mgd (including domestic self-supply). Excluding domestic self-supply, 1,090 mgd of water were withdrawn from the state water resources under the authority of 8,228 WUPs. The use category having the highest quantity withdrawn was public supply for 483 mgd, and Hillsborough County had the highest public supply withdrawal rate (165 mgd). The second highest quantity withdrawn was for agriculture for 467 mgd, and most of the agricultural water withdrawals were in Polk County (105 mgd).

Total water use in the District was 1,135 mgd in 2010, including domestic self-supply (Table 9). The difference between total water withdrawn and total water used is due to public supply treatment losses as well as transmission losses. Also, the "Total Withdrawal" column differs from the "Total Use" column for public supply for each county because a portion of the water withdrawn for public supply in one location is transferred to another location to be used. The highest water use in 2010 was for agricultural purposes for 467 mgd, with Polk County having the highest agricultural use (105 mgd). Public supply was the second highest use of water in the District in 2010 for 459 mgd. Hillsborough County had the highest public supply use (109 mgd). Assuming all the water withdrawn for agriculture, industrial/commercial, mining/dewatering, and recreation/aesthetic uses met the demand for water in these categories, and using the public supply used quantity as demand, the total water demand in the District was for 1,135 mgd in 2010 (Table 9 in the "Total Use" column). Excluding domestic self-supply, the total water demand that was met with water use permits in the District was 1,067 mgd.

Figure 14 illustrates that 22% of the water withdrawn in the District was in Hillsborough County, and 21% was in Polk County.

Figure 15 illustrates the amount of groundwater versus surface water withdrawn by each county.

2010 Estimated Water Use

In 2010, the most groundwater was withdrawn in Polk County (222 mgd), and the most surface water was withdrawn in Hillsborough County (109 mgd). For more information on groundwater versus surface water use, please refer to the tables in Appendix B.

SUMMARY

During 2010, approximately 1,090 mgd was withdrawn from the resource under the authority of water use permits, and 1,067 mgd was used in the District. Public supply was the highest withdrawal use category with agriculture being second. With respect to the amount of water used, agriculture was the highest use category with public supply use being a close second. Water users in Polk County withdrew the most water to support its diverse agricultural operations, industries and population.

Analysis of multi-year, water-use trends depends on complex combinations of factors that differ from use category to use category. Some of these factors include economic climate, annual rainfall, and political climate. While complex relations exist between these factors, past and on-going refinements of District methodologies have resulted as the District strives for continually better estimations of water use.

For 2010, 28 mgd of water that was withdrawn from the resource and stored for a short time in a pond before being pumped to its final use was included. Recreation/aesthetic gained the most with 20 mgd being added to its total withdrawal quantity.

Tables A-1, A-2 and A-3 in Appendix A reflect the complicated nature of public supply water use and water withdrawal transactions. District staff are meeting to discuss a better way to portray regional water supply systems in the future because the quantities withdrawn under the main WUP do not go directly to an associated service area. The Peace River Manasota Regional Water Supply Authority does not have a service area. It only exports water to other utilities that do have service areas. Tampa Bay Water has a consolidated WUP that includes many wellfields delivering water to a central location from which the water is parceled out to customers in multiple service areas according to need. Tampa Bay

Water also has other public supply WUPs that deliver water to a service area in addition to supplying other service areas as the need arises. It is very difficult to portray these regional water supply systems in the conventional way of withdrawals minus treatment losses going to a set service area to generate a per capita rate for that service area.

Future EWU reports will endeavor to capture all of the water that is withdrawn in the District, such as water used for environmental mitigation, water used to supplement pressure in pressurized reclaimed water lines, and a way to better portray the water used in the mining industry by product type.

* Data only for portion of the county within the District

¹ Total (Withdrawal) - Represents the sum of the preceding six columns and represents total water withdrawal by county for all categories.

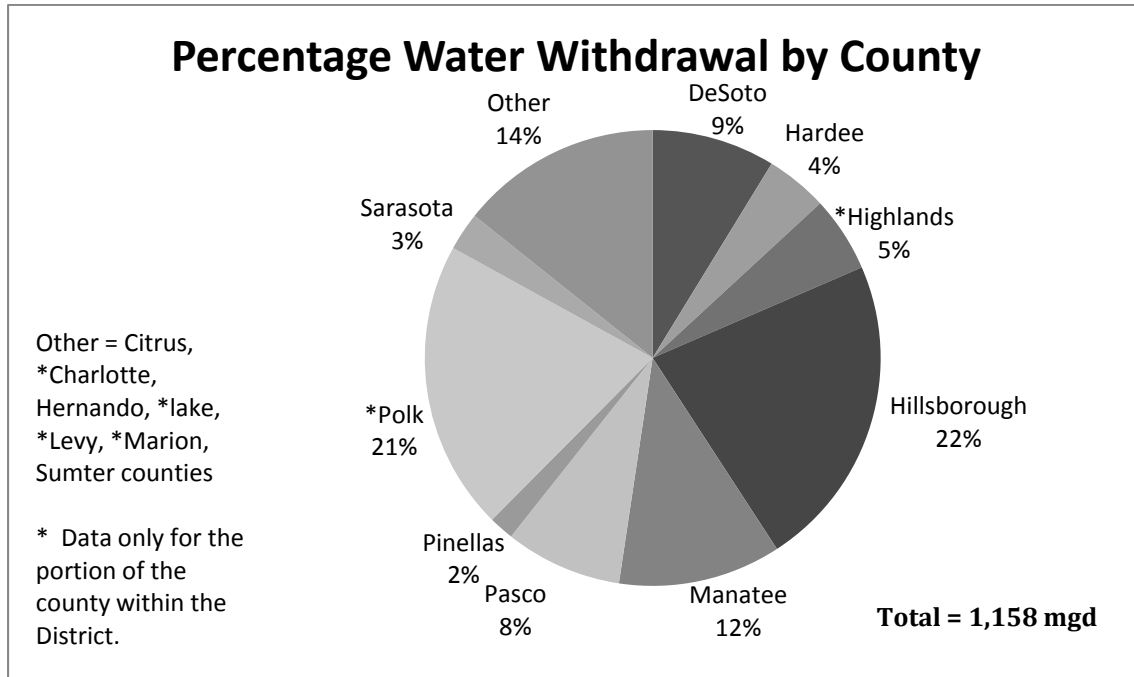

² Public supply (Use) - Represents total consumptive use of public supply water within a county, excluding domestic self-supply. When compared to public supply (Withdrawal) column, a large difference would represent an import or an export of publicly supplied water from one county to another.

³ Total (Use) = The sum of "Total (Withdrawal)" minus "Public Supply (Withdrawal)" plus "Public Supply (Use)" represents consumptive use of publicly supplied water in the county.

NOTE: Public supply (Use) versus (Total Withdrawal) differences in Citrus, Hardee, Hernando, Highlands, and Marion are the result of data being obtained from two different sources with slightly different numbers (not inter-county transfers).

APPENDIX A.

DETAILED LIST

OF WATER WITHDRAWALS AND USE

BY WATER USE PERMIT

2010 Estimated Water Use Appendix A

IMPORTANT INFORMATION REGARDING TABLE A-1

The permittee of each public supply water use permit (WUP) issued for 100,000 gpd or greater receives a Public Supply Annual Report (PSAR) form in November or December each year. The PSAR form is required to be completed with information about the permittee's water use. This water use information is:

- Pumpage,
- Imports from any source,
- Exports to any receiver,
- Imports from and exports to other public supply permittees,
- Treatment plant losses,
- Significant use,
- Environmental mitigation,
- Golf course irrigation use,
- Service population estimates (both permanent and seasonal),
- Alternative Water Supply (AWS) supplied to customers,
- Desalination information, if any,
- Quantifiable water losses such as those for fire suppression,
- An estimate of the non-quantifiable losses that may have occurred in distributing the water to customers, and
- Percentage breakout of water supplied by customer-type.

A compilation of the data received by the District is presented in Tables A-1, A-2, and A-3. Each table indicates if the PSAR form was received. This year (2010) is the last year that submittal of the PSAR form is voluntary for public supply permittees not located in a water use caution area (WUCA). If a PSAR was not received, the District estimated the requested data using the District database (WMIS) for pumpage and the Bureau of Economic and Business Research (BEBR) population estimates. If pumpage information submitted to the District is significantly different than BEBR estimates, an individual evaluation is made using BEBR and the permittee's submitted data. It is also important to note that compliance checks of the information submitted to the District are independent of this report. Also, if the pumpage submitted on the PSAR form is different from that contained in the WMIS database, the files were reviewed and the best data is offered in this report. All quantities given are in million gallons per day (mgd) to the nearest thousand gallons.

Table A-1 presents a detailed list of the larger public supply WUPs throughout the District. The intent is to portray a snapshot of the water uses and per capita rates for these permits. The information given after the identification of the county, permit number and permittee name is the raw pumpage, imports from other sources into this permittee's service area, exports to other service areas and treatment losses. The Gross Use is the result of adding imports and subtracting exports and treatment losses. This is the water amount provided to the population that is indicated in the next column.

2010 Estimated Water Use Appendix A

Per Capita:

- The “Unadjusted Gross Per Capita” (UGPC) rate is the result of dividing the gross use by the population and gives the first portrayal of water use per person.
- The District adopted rules that allow a better comparison of water use per person between other public supply permittees by allowing them to subtract quantities supplied for non-residential uses, such as those provided to industries, large health care or educational facilities, in the service area before calculating a per capita rate. Documentation is required to claim these deductions, and once they are made, the per capita rate is called the “Adjusted Gross Per Capita” (AGPC). If there are no allowable non-residential uses in the service area, the UGPC and the AGPC are the same.
- If the public supply permittee contributes to the lessening of water demand from the natural resources by providing AWS supplies to customers outside of their service area, they are allowed to make deductions for those resource savings. This is the “Compliance Per Capita” (CPC) rate. If the permittee does not supply AWS to customers outside of their service area, the CPC rate is the same as the AGPC.

The reason there are three methods of calculating per capita rates is because the District adopted a rule that all public supply permittees must attain a per capita rate of no more than 150 gpd by December 31, 2019. Further, any permittee having a per capita rate calculated as the average of the lowest rate per year for the years 2005 through 2009 that was above 150 gpd/person has to be halfway to the 2019 goal of 150 gpd/person by December 31, 2014.

As mentioned above, the Estimated Water Use Report for any year does not result in compliance or enforcement activity from the Regulation Division. Such activity is conducted separately

PSAR NOT RECEIVED	26	Unadjusted Gross PC > 150	23	Adjusted Gross PC > 150	18	Compliance PC > 150	16
TOTAL DUE	175						

NOTES:

- (GPCD) GALLONS PER CAPITA PER DAY
- (MGD) MILLION GALLONS PER DAY
- PSAR RECEIVED Public supply annual report was received.
- PSAR NOT RECEIVED Public supply annual report not received. Withdrawal amount was metered and gpd was calculated from the District database. Population served was derived from "Florida Estimates of Population 2010 - 2035, March 2010, Bureau of Economic and Business Research.

Subtotals may not match quantities shown due to rounding in the Excel program used to create this table.

Please note that data in these tables may not exactly match what was reported in the public supply annual reports due to rule requirements and supporting documentation conditions required per chapter 40D-2, Florida Administrative Code, and the Water Use Permit Information Manual , Part B, Basis of Review.

Explanations for numbers in parentheses in the table above:

- (1) GW = Ground Water, SW = Surface Water, RO = Reverse Osmosis
- (2) IMPORT = Water purchased or transferred from another utility
- (3) EXPORT = Water sold or transferred to another utility
- (4) TREATMENT LOSS = Annual average gallons per day which are lost in routine treatment for potability. This includes, but is not limited to, desalination reject water, sand filtration

2010 Estimated Water Use Appendix A

backwash, and quantities used to maintain appropriate water quality in pipelines or tanks. Treatment losses are calculated as raw water into the plant minus treated water out of the plant. In addition, this can include no more than 1% of treated water volume delivered to the distribution system for flushing distribution lines for potability.

- (5) GROSS USE [Also called "finished water"] = (Withdrawal + Import) - (Export + Treatment Loss).
- (6) UNADJUSTED GROSS PER CAPITA = (Gross Use) ÷ (Functional Population). Population-related withdrawals associated with residential, business, institutional, industrial, miscellaneous metered, and unaccounted water uses are applicable to all public supply benefits.
- (7) SIGNIFICANT USE = There are five options. A: Single Significant Use; B: District-Wide Percent I/C Use; C: Combined Regional Government and Higher Education Facilities; D: Individual Regional Health Facilities; E: Individual Industrial/Commercial Facilities Where Water is the Primary Ingredient or Final Product. Definitions and exclusions of each type are given in the BOR, Chapter 3, Section 3.6.
- (8) GOLF COURSE DEDUCTION = Separately metered golf course irrigation quantities from ground water, surface water, reclaimed water, or storm water provided to golf courses inside the service area. The quantities provided may be deducted only if they are included in the permitted quantities for the service area and reported as withdrawals (WD) in the Annual Report. The "GC" withdrawal quantities deducted shall not exceed those actually provided, or those that would be permitted for use by the District, whichever is less.
- (9) ENVIRONMENTAL MITIGATION = Annual average quantities used by a utility to mitigate withdrawal-related stress to a specified environmental feature as required by the utility's Water Use Permit (WUP)
- (10) ADJUSTED GROSS PER CAPITA = (Gross Use) - (Significant Uses + Golf Course Deduction + Environmental Mitigation) ÷ Functional Population).
- (11) STORM WATER DEDUCTION = Separately metered and reported stormwater quantities captured by the permittee that are included in the utility's permitted quantities for uses inside the service area other than for golf course irrigation. The stormwater withdrawal quantities deducted shall not exceed the quantities actually provided, or those that would be permitted for the use by the District, whichever is less. Stormwater quantities deducted as golf course (GC) use above may not be included in this deduction for stormwater. The surface withdrawal points from the stormwater catchments shall be permitted on the provider's water use permit and must be reported as withdrawals in the Annual Report to be deducted. The stormwater deduction shall not be taken where the quality of the ground water source to be permitted or replaced is of lower water quality but is suitable for the intended use, unless the use of the stormwater in such cases reduces adverse impact to the water resources.
- (12) RECLAIMED WATER DEDUCTION = A deduction from the gross per capita that is applicable if the utility provides reclaimed water for beneficial use to an area as set forth in the BOR, Chapter 3, Section 3.1.
- (13) COMPLIANCE PER CAPITA = ((gross use) - (significant use + golf course deduction + environmental mitigation + stormwater deduction + reclaimed water deduction)) divided by (Functional Population). This is a rate that is calculated for compliance with the 150 gpd per person limit.
- (14) WUP No. 10420: ASR recovered shown as Import; ASR stored shown as Export. Deficit made up with withdrawals from surface storage

2010 Estimated Water Use Appendix A

- (15) WUP No. 6029 includes WUP No. 7811 (Mink Assoc.)
- (16) Hillsborough County/TBW Wholesale WUP population is based on 2009 BEBR-MED Projections - 5-11-2011 Model Run; WUP 20141 issued in 2011. WUP No. 5886.004 is included in these import totals.
- (17) WUP No. 5347: ASR recovered shown as Import; ASR stored shown as Export.
- (18) WUP No. 12921: No pumpage; well not constructed.
- (19) WUP No. 4734 includes WUP No. 422.
- (20) WUP No. 10141 did not have any withdrawals in 2010. Construction of the development was not initiated.
- (21) WUP No. 12964 did not have any withdrawals in 2010. Construction of the production well has not begun.
- (22) WUP No. 4318 includes #10224 SAR
- (23) WUP No. 7799 did not report pumpage in WUP No. 2010. No records found in WMIS.
- (24) WUP No. 13123 population was calculated using 251 mobile home pads x 2.16 persons per household (PPH) (2009 BEBR PPH for Sumter Co.)
- (25) WUP No. 11771, TBW Consolidated withdrawals quantities were divided per county location according to data submitted in .ftp download.

2010 Estimated Water Use Appendix A

The following section of Table A-1 gives information for public supply WUPs that are not required to submit a Public Supply Annual Report. Some of the WUPs in the following table are metered, and actual pumpage is provided. Other WUPs are not metered, and the pumpage was estimated.

Table A-1, Part 2. Public Supply, Metered (M)(no PSAR) and Estimated (E) Public Supply Water Use And Permitted Use (Mgd) By Permittee, Source, Estimated (E), Metered (M), By County, 2010

Source: District Water Use Permit Database (WMIS), Calendar year 2010

Information is given only for the portion of the county within the SWFWMD for those counties not wholly within the SWFWMD.

- Notes:
- ¹ Use Code: Alpha-numeric number given to the use that has the highest quantity attributed to the permit. The first letter indicates the "Predominant Use" on the permit (A=Agricultural, I = Industrial/Commercial, M = Mining/Dewatering, R = Recreation/Aesthetic and P = Public Supply. The list for each Use Code used in the table is below.
 - ² Source = Groundwater (G) or Surface Water (S)
 - ³ The metered or estimated annual average amount pumped (aka used, withdrawn) in 2010.
 - ⁴ Many water use permits have more than one Use Type. This column shows the total annual average quantity permitted to that WUP that is under the same Predominant Use as is indicated by the first letter in the Use Code.

2010 Estimated Water Use Appendix A

The table below defines the use codes presented in this table.

P020	Augmentation for Environmental	P100	Personal Sanitary Use
P040	Commercial/Industrial	P115	Residential (Provided By a Non-Utility Provider)
P060	Fire Fighting/Testing	P120	Residential Multi-Family
P070	Lawn & Landscape Irrigation	P130	Residential Single Family
P075	Common Area Irrigation	P131	Residential Mobile Home
P080	Other Metered Uses	P135	Temporary Employee Housing

2010 Estimated Water Use Appendix A

TABLE A-2

Table A-2 presents information given by permittees on the PSAR forms regarding the end use of water for different categories. The Gross Use is the same amount as derived on Table A-1. The percentage given for residential use are for the proportion of water supplied to single-family and multi-family dwellings units as well as to mobile homes. The table shows the proportion (%) of water provided for industrial/commercial use (I/C), mining/dewatering use (M/D), agricultural use (AG), and recreation/aesthetic use excluding golf course (R/A), and that for golf course irrigation (GC). The percentages are shown for the proportion of their gross water supply used for fire suppression and testing as well as for other ancillary water needs, such as line flushing, that can be quantified (F&O). Any differences between the amount of water leaving the treatment plant and the amount recorded at the customers' meters are non-quantified water losses (WL). Such water losses are the result of leaking pipelines, pipeline breaks, users tapping into the supply illegally, and under-registering customer meters.

The quantities supplied for residences only is divided by the functional population that was provided to generate a residential per capita rate. This rate is not included in the rates used to determine compliance with the required per capita rate of 150 gpd. The exclamation point after the WUP Number indicates that a PSAR form was not received. As mentioned earlier, these were only required in the WUCAs in 2010 unless specifically stated in the terms of the WUP.

TABLE A-2: REPORTED/ESTIMATED PUBLIC SUPPLY WATER USE DETAILS, 2010

COUNTY	WUP No.	PERMITTEE NAME(S)	GROSS USE (mgd) (1)	% RES (2)	% I/C (3)	% M/D (4)	% AG (5)	% R/A (6)	% GC (7)	% F & O (8)	% WL (9)	RES. USE (mgd) (10)	POP SERVED (11)	RES. PER CAPITA (gpcd) (12)	GROSS PER CAPITA (gpcd) (13)	I/C USE (mgd) (14)	GC USE (mgd) (18)	WL (mgd) (20)
--------	---------	----------------------	------------------------------	-----------------	-----------------	-----------------	----------------	-----------------	----------------	-------------------	----------------	------------------------------	-----------------------	---	--	-----------------------------	----------------------------	---------------------

NOTES:

(MGD) = million gallons per day

(1) Gross Use is taken directly from Table A-1, column 10, and represents the total amount of water withdrawn plus imports minus exports and treatment loss.

(2) Percent of water supplied that is used for residential purposes only.

(3) Percent of water supplied that is used for industrial/commercial purposes only.

(4) Percent of water supplied that is used for mining/dewatering purposes only.

(5) Percent of water supplied that is used for agricultural purposes only.

(6) Percent of water supplied that is used for recreational/aesthetic purposes only.

(7) Percent of water supplied that is used for Golf Course purposes only.

(8) Percent of water supplied that is used for fire fighting, line flushing, and other accountable purposes only.

(9) Percent of water supplied that is considered lost or unaccounted for due to system leaks, illegal connections, etc.

(10) Residential Use = (Gross Use) X (% Residential). This number represents the total amount of water that is used for residential purposes only.

(11) Population Served is taken directly from Table A-1, column 11, and represents the served population for the permittee listed.

(14) I/C Use (Industrial/Commercial Water Use) = (Gross Use) X (% I/C). This number represents the amount of Public Supply water that is used for Industrial/Commercial purposes only.

(15) M/D Use (Mining/Dewatering Use) = (Gross Use) X (% M/D). This number represents the amount of Public Supply water that is used for Mining/Dewatering purposes only.

(16) AG Use (Agriculture Use) = (Gross Use) X (% AG). This number represents the amount of Public Supply water that is used for Agriculture purposes only.

(17) REC/AES Use (Recreational/Aesthetic Use) = (Gross Use) X (% REC/AES). This number represents the amount of Public Supply water that is used for Recreational purposes only.

(18) GC Use (Golf Course Use) = (Gross Use) X (% GC). This number represents the amount of Public Supply water that is used for Golf Course purposes only.

(19) F & O Use (Fire and Other) = (Gross Use) X (% F&O). This number represents the amount of Public Supply Water that is used for Fire Supply and Other purposes only.

(20) Water Loss (Water Loss) = (Gross Use) X (% WL). This number represents the amount of water that is lost or unaccounted for each day by the permittee listed.

2010 Estimated Water Use Appendix A

Table A-3. This table shows the transfers of water among and between public supply permittees in the District as well as to communities outside of the District. The chart is organized by county into which water is imported. The quantity imported is given, and the identity of the exporter in the same county is read across the chart. Note, there are cross-county transfers, so individual permittees will be listed more than once if appropriate.

Table A-3: Reported Public Supply Permit-To-Permit Water Transfers, 2010

Grand Total Imports:			229.467	Grand Total Exports:			231.264

Notes: Imported and exported water quantities are not equal due to losses during transport through the distribution systems, reporting differences from water suppliers and receivers, transfers within regional water supply systems, use of aquifer storage and recovery facilities across reporting years.

Quantities shown were supplied by the permittee listed.

* Imports to utilities outside of the District are not included in totals.

Source: Water Use Permit Database (WMIS), Calendar year 2010.

- Notes:
- ¹ Use Code: Alpha-numeric number given to the use that has the highest quantity attributed to the permit. The first letter indicates the "Predominant Use" on the permit. (R = Recreation/Aesthetic). Descriptions of the use codes in this table are on the next page.
 - ² Source = G for groundwater; S for surface water
 - ³ The metered or estimated annual average amount pumped (aka used, withdrawn) in 2010.
 - ⁴ This value gives an indication if the issued WUP is entirely for recreation/aesthetic use (the quantities in the 7th and 8th columns are equal), or has water permitted under another predominant use (quantity in 7th column > quantity in 8th column).

Descriptions for the use codes given in this table.

R200	Aesthetic Use Other than Augmentation	R260	Botanical Specimen Irrigation
R210	Augmentation for Aesthetic	R270	Fire Fighting/Testing
R220	Augmentation for Environmental	R280	Maintenance & Cooling
R230	Cemetery/Parks/Playgrounds	R290	Other Uses
R240	Lawn & Landscape Irrigation	R300	Recreational Animal Watering Use
R244	Irrigation Of Community Common Areas	R310	Personal Sanitary Use
R245	Sports Playing Fields	R320	Water-Based Recreation
R250	Golf Course Irrigation	R405	Closed Loop Heating and Cooling

¹ Use Code: Use Code: Alpha-numeric number given to the use that has the highest quantity attributed to the permit. The first letter indicates the "Predominant Use" on the permit (A=Agricultural, I = Industrial/Commercial, M = Mining/Dewatering, R = Recreation/Aesthetic and P = Public Supply)

Notes:

2010 Estimated Water Use Appendix A

- 2 Source = Groundwater (G), Surface Water (S)
- 3 The metered or estimated annual average amount pumped (aka used, withdrawn) in 2010.
- 4 This value gives an indication if the issued WUP is entirely for agricultural use (the quantities in the 7th and 8th columns are equal), or if water is also permitted under another predominant use (quantity in 7th column > quantity in 8th column).

Use Code Descriptions

A400	Augmentation for aesthetic	A50F	Fall peppers

- ¹ Use Code: Alpha-numeric number given to the use that has the highest quantity attributed to the permit. The first letter indicates the "Predominant Use" on the permit (A=Agricultural, I = Industrial/Commercial, M = Mining/Dewatering, R = Recreation/Aesthetic and P = Public Supply. The list for each Use Code used in the table is below.
- ² Source = Groundwater (G) or Surface Water (S)
- ³ The metered or estimated annual average amount pumped (aka used, withdrawn) in 2010.
- ⁴ Many water use permits have more than one Use Type. This column shows the total annual average quantity permitted to that WUP that is under the same Predominant Use as is indicated by the first letter in the Use Code. The use codes shown in this chart are defined below.

M905	Augmentation for Environmental	M960	Sand & Gravel Processing
M910	Lawn & Landscape Irrigation	M965	Sand & Gravel Dewatering
M915	Limestone Processing	M970	Shell Pit Dewatering

Source: Water Use Permit Database (WMIS), Calendar year 2010

Notes:

- ¹ Use Code: Alpha-numeric number given to the use that has the highest quantity attributed to the permit. The first letter indicates the "Predominant Use" on the permit (A=Agricultural, I = Industrial/Commercial, M = Mining/Dewatering, R = Recreation/Aesthetic and P = Public Supply. The list for each Use Code used in the table is below.
- ² Source = Groundwater (G) or Surface Water (S)
- ³ The metered or estimated annual average amount pumped (aka used, withdrawn).
- ⁴ Many water use permits have more than one Use Type. This column shows the total annual average quantity permitted to that WUP that is under the same Predominant Use as is indicated by the first letter in the Use Code.

2010 Estimated Water Use Appendix A

Descriptions for the Use Codes are given in this table.

I412	Cleaning and Maintenance	I805	Industrial Other Uses
I423	Emission Control	I810	Meat Packing
I425	Emission Control	I825	Non-Power-Plant Non-Consumptive Cooling
I511	Product Mixing and Dilution	I830	Perishable Food Processing
I700	Air Conditioning	I835	Phosphate Chemical Processing

*WUP = Water Use Permit

Source: District WMIS Database as of December 31, 2010

Note 1: "Permitted" represents the total daily average quantity (mgd) permitted by the District as of 2010.

Note 2: When no pumpage has been reported by a permittee during the year, "." is shown.

Note 3: Permits that were included in the 2009 list have been removed from this list if they were modified to be less than 1.0 MGD on an Annual Average basis.

Note 4: Permits that were in "Inactive" status on December 31, 2010 will not be listed.

¹ WUP Nos. 266 and 5245 were combined into WUP 11863 in 2010.

² This Pinellas County WUP is issued for environmental mitigation in Pasco County

* WUP = Water Use Permit

Source: District WUP Database (WMIS) as of December 31, 2010

Note 1: "Permitted" represents the total daily average quantity (mgd) permitted by the District as of 2010.

Note 2: When no pumpage has been reported by a permittee during the year, "." is shown.

Note 3: Permits that were included in the 2009 list have been removed from this list, if they were modified to be less than 1.0 MGD on an Annual Average basis.

Note 4: Permits that were in "Inactive" status on December 31, 2010 will not be listed.

³ Meter readings were not submitted for 2010.

Source: Public Supply Annual Reports. When an annual report was not submitted, census data and District records on pumpage were used.

Note 1: WUPs that no longer exist because they have been combined were removed from this report. Footnotes below describe the combinations.

Note 2: A dot (".") represents a lack of previous data because a permit that was not tracked in this report or the permit was only recently issued, or it represents a lack of data because the permit no longer exists.

Note 3: The unadjusted gross per capita only has water loss deducted for 2010. The reader should be cautious when comparing per capita rates across the years because they were calculated in different ways as the governing rules for water use regulation (Chapter 40D-2, Florida Administrative Code) changed.

(1) WUP Nos. 5786 and 7811 were combined into WUP No. 6029.

2010 Estimated Water Use Appendix D

- (2) WUP No. 13099 was formerly WUP No. 4708. Data shown for WUP No. 13099 includes data from 1999 - 2006 from WUP No. 4708.
- (3) WUP No. 11863 now includes WUP Nos. 25, 266, 5245, 6011 and 6028.
- (4) WUP No. 20142 was not issued until 2011.
- (5) WUP No. 4318 now includes WUP No. 10224.
- (6) WUP Nos. 4836 and 7411 were combined into WUP No. 8836 on 08/28/07. WUP No. 8836 also now includes the service area for WUP No. 4709.
- (7) WUP No. 4842 was combined into WUP No. 2983 in 2008.
- (8) WUP No. 2841 combined into WUP No. 377 in 2007.
- (9) WUP No. 4279 was combined into WUP No. 4607 in 2004.
- (10) WUP Nos. 11404 and 12236 were combined into WUP No. 13005 in 2007.

(MGD) = million gallons per day

* Wholesale Water Importer

PSAR = Public Supply Annual Report for 2010. If it was received, the space is blank. If it was not received, "N" appears in the space. Not all public supply permittee were required to submit a PSAR in 2010.

- (1) GW = ground water, SW = surface water, RO = reverse osmosis
 - (2) IMPORT = Water purchased or transferred from another utility.
 - (3) EXPORT = Water sold or transferred to another utility.
 - (4) TREATMENT LOSS = Annual average gallons per day which are lost in routine treatment for potability. This includes, but is not limited to, desalination reject water, sand filtration backwash, and quantities used to maintain appropriate water quality in pipelines or tanks. Treatment losses are calculated as raw water into the plant minus treated water out of the plant. In addition, this can include no more than 1% of treated water volume delivered to the distribution system for flushing distribution lines for potability.
 - (5) GROSS USE (also called "finished") = (withdrawal) + (import) - (export) - (treatment loss).
 - (6) HOUSING UNITS SERVED = Housing units served reported by the utility. If no data was submitted in 2010, the estimated housing units served was based on 2009 BEBR-MED Projections - 5-11-2011 Model Run ÷ 2000 US Census Persons Per Household.
 - (7) AVG PPH = Average Persons Per Household. 2000 Census PPH by utility service area. 062808 Appendix C Worksheets, Demographics Web-Page. For utility service areas where no PPH calculation was made, the countywide Utility PPH average was used as determined by the Florida Statistical Abstract, 2009 - Bureau of Economic and Business Research; *Florida Population Studies*, January 2009, Volume 42, Bulletin No. 152
 - (8) RESIDENTIAL POPULATION SERVED = (housing units served reported by the utility) * (2000 census utility service area average persons per household). If no data was submitted in 2010, the estimated housing units served was based on 2009 BEBR-MED Projections - 5-11-2011 Model Run ÷ 2000 US Census Persons Per Household.
 - (9) DEP GROSS PER CAPITA = (gross use) / (residential population served). Population-related withdrawals associated with residential, business, institutional, industrial, miscellaneous metered, and water loss uses are applicable to all public supply permits.
 - (10) RESIDENTIAL USE = Use reported by utility for only residential purposes. If no data was submitted for 2010 the countywide % residential use was applied.
 - (11) RESIDENTIAL PER CAPITA = = [(residential use) / (residential population served)].
- != NO PUBLIC SUPPLY ANNUAL REPORT DATA WAS RECEIVED FOR THIS WUP - Withdrawal totals were based on reported annual metered pumpage and population was based on 2009 BEBR-Med Projections - 5-11-2011 Model Run.
