# **Hydrologic Conditions**

for the month of

# March 2022

Prepared by the

Hydrologic Data Section

Data Collection Bureau

April 26, 2022

http://www.watermatters.org

#### **ACKNOWLEDGMENTS**

The Hydrologic Conditions Report is a monthly effort of the Data Collection Bureau's Hydrologic Data Section. Acknowledgment is made to the following staff for their significant contributions, hard work and dedication to the timely production of this report:

Data Collection: Terry Burrell, Dave Goldberg-Dunnett, Don Everson,

George Prine, James Ferrell, Greg Johnston, Everett

Eldridge, Robert Noland, Aaron Cronk, James

Thomas and Grayson Conklin.

QA/QC and Reporting: Steve DeSmith, Hunter Alexander, Joey Fogel,

Cortney Cameron and Jason Patterson.

Administrative Support/

Document Preparation: Karen Diez, Lora Caruso and Shelley Browning.

#### INTRODUCTION

The Hydrologic Conditions Report is generated monthly by the Hydrologic Data Section, Data Collection Bureau, of the Southwest Florida Water Management District. This report provides an end-of-month analytical summary of regional and temporal variations in the hydrologic conditions across the District's 16-county area for planning and regulatory purposes. In addition, it provides an excellent historical record for long-term local and regional hydrologic analysis. [Notice: There have been substantial changes to the content of this monthly report, as of the July 2020 report.]

The Hydrologic Data Section is responsible for the implementation and maintenance of a network of observation and monitoring stations used to track changes in various hydrologic parameters over time. Data collected are used by the regulatory, technical, and analytical sections of the District. All data collected are processed and analyzed, uploaded into a centralized data base maintained by the District and then made available to the public through the District's Environmental Data Portal. The District's data collection program is augmented with data collected by the United States Geological Survey (USGS) through a cooperative joint funding agreement. Data derived from both District and USGS sources are used in this report.

The data contained in this report were collected and analyzed in accordance with generally accepted procedures consistent with applicable scientific and technical standards of practice. The data presented are considered to be the best available at the time of publication and are subject to revision.

Any questions about the significance, accuracy, or interpretation of these data should be referred to Tamera McBride, Manager of the Hydrologic Data Section at (352) 796-7211 or (800) 423-1476, extension 4284.

The data evaluation, analyses and interpretation contained within this report have been prepared or approved by a certified Professional Geologist in accordance with Chapter 492, Florida Statutes.

# Americans with Disabilities Act (ADA)

The Southwest Florida Water Management District (District) does not discriminate on the basis of disability. This nondiscrimination policy involves every aspect of the District's functions, including access to and participation in the District's programs, services and activities. Anyone requiring reasonable accommodation, or who would like information as to the existence and location of accessible services, activities, and facilities, as provided for in the Americans with Disabilities Act, should contact the Human Resources Office Chief, at 2379 Broad St., Brooksville, FL 34604-6899; telephone (352) 796-7211 or 1-800-423-1476 (FL only), ext. 4747; or email ADACoordinator@WaterMatters.org. If you are hearing or speech impaired, please contact the agency using the Florida Relay Service, 1-800-955-8771 (TDD) or 1-800-955-8770 (Voice). If requested, appropriate auxiliary aids and services will be provided at any public meeting, forum, or event of the District. In the event of a complaint, please follow the grievance procedure located at WaterMatters.org/ADA.

#### **EXECUTIVE SUMMARY**

### **Hydrologic Conditions for March 2022**

In March, average rainfall totals were significantly above-normal in the northern counties of the District, while they were within the normal range in the central and southern counties. The normal range for rainfall is defined by totals that fall on or between the 25<sup>th</sup> to 75<sup>th</sup> percentiles of the historical monthly accumulation for each region and where the 50<sup>th</sup> percentile represents the historical mean. The northern counties received an average of 8.22 inches of rainfall, equivalent to the 96<sup>th</sup> percentile of the historical March record. The central counties received an average of 3.40 inches of rainfall, equivalent to the 61<sup>st</sup> percentile, while the southern counties received an average of 1.43 inches of rainfall, equivalent to the 35<sup>th</sup> percentile of the historical March record. The District-wide rainfall average of 4.05 inches was equivalent to the 68<sup>th</sup> percentile of the historical March record.

During the 12-month period from April 1, 2021, through March 31, 2022, the average rainfall totals in the northern counties were classified as "wetter than normal," while the central counties were classified as "normal", and the southern counties were classified as "drier than normal." The northern counties received an average of 62.87 inches of rainfall, equivalent to the 90<sup>th</sup> percentile of the historical annual record. The central counties received an average of 47.76 inches of rainfall, equivalent to the 32<sup>nd</sup> percentile, while the southern counties received an average of 45.62 inches of rainfall, equivalent to the 24<sup>th</sup> percentile. The District-wide rainfall average of 51.19 inches was equivalent to the 43<sup>rd</sup> percentile of the historical annual record.

Average lake levels in March were within the normal range in the Northern, Tampa Bay and Polk Uplands regions of the District, while they were below normal in the Lake Wales Ridge region. Normal lake levels are defined as levels that fall between the minimum low management level and the minimum flood level. Lake levels in the Northern region decreased slightly by an average of 0.01 foot and were 0.00 foot (equal to) the base level of the annual normal range. Lake levels in the Tampa Bay region decreased an average of 0.07 foot and were 0.65 foot above the base of the annual normal range. Average lake levels in the Polk Uplands region increased slightly by an average of 0.02 foot and were 1.15 feet above the base of the annual normal range. Average lake levels in the Lake Wales Ridge region decreased by 0.28 foot and ended the month 0.49 foot below the base of the annual normal range.

Total streamflow in March, based on three regional index rivers, was within the normal range in the northern and central counties of the District, while it was below normal in the southern counties. Normal streamflow is defined as the flow that falls on or between the 25<sup>th</sup> and 75<sup>th</sup> percentiles. Streamflow measured at the Withlacoochee River near Holder station in the northern counties decreased and was at the 40<sup>th</sup> percentile. Streamflow in the Hillsborough River near Zephyrhills station in the central counties increased slightly and was at the 38<sup>th</sup> percentile, while total streamflow measured at the Peace River at Arcadia station in the southern counties decreased and was at the 10<sup>th</sup> percentile during March.

In March, groundwater data showed that the average regional level in the Upper Floridan aquifer was above-normal in the northern counties of the District, while it was within the normal range in the central and southern counites. The normal range is defined as levels that fall on or between the 25<sup>th</sup> and 75<sup>th</sup> percentiles. The average regional groundwater level in the northern, central and southern counties were at the 76<sup>th</sup>, 53<sup>rd</sup> and 47<sup>th</sup> percentiles, respectively.

### REGIONAL OVERVIEW OF HYDROLOGIC CONDITIONS

### **MARCH 2022**

For this report, the District has been divided into three geographical regions that are defined by county boundaries, unless otherwise indicated. Each regional area includes all or part of each county that is located within that region and that is also within the District's jurisdictional boundaries. The northern region includes the counties of Citrus, Hernando, Lake, Levy, Marion and Sumter; the central region includes the counties of Hillsborough, Pasco, Pinellas and Polk; while the southern region includes the counties of Charlotte, DeSoto, Hardee, Highlands, Manatee and Sarasota.

### **Northern Region**

In March, the northern region received an average of 8.22 inches of rainfall, equivalent to the 96<sup>th</sup> percentile of the historical March readings, which is considered "very wet." Average lake levels decreased in the northern region and ended the month with the regional level equivalent to the base of the annual normal range. Total streamflow measured in the Withlacoochee River near Holder station decreased and was in the 40<sup>th</sup> percentile. Regional groundwater levels indicated Upper Floridan aquifer water levels increased and were in the 76<sup>th</sup> percentile.

### **Central Region**

In March, the central region received an average of 3.40 inches of rainfall, equivalent to the 61<sup>st</sup> percentile of historical March readings, which is considered "normal." Average lake levels decreased in the Tampa Bay region while slightly increasing in the Polk Uplands region, ending the month 0.65 foot and 1.15 feet, respectively, above the base of the annual normal range. Total streamflow measured at the Hillsborough River near Zephyrhills station increased slightly and was in the 38<sup>th</sup> percentile. Regional groundwater levels indicated average Upper Floridan aquifer water levels decreased and were in the 53<sup>rd</sup> percentile.

### **Southern Region**

In March, the southern region received an average of 1.43 inches of rainfall, equivalent to the 35<sup>th</sup> percentile of historical March readings, which is considered "normal." Average lake levels decreased in the Lake Wales Ridge region and ended the month 0.49 foot below the base of the annual normal range. Total streamflow measured at the Peace River at Arcadia station decreased and was in the 10<sup>th</sup> percentile. Regional groundwater levels indicated average Upper Floridan aquifer water levels decreased and were in the 47<sup>th</sup> percentile.

### **RAINFALL**

The rainfall data used for all tabulations in this report are provided to the District under contract with an external vendor. These data are created by enhancing contractor-developed NEXRAD radar rainfall imagery with 15-minute rainfall data collected from the District's network of real-time gauges. This process results in rainfall estimates for every 1.5 square-miles over the entire District, filling in those portions where rainfall data collection would otherwise be limited due to gaps in the gauging network.

Rainfall data are evaluated by using the current values to calculate percentiles in order to determine how normal or abnormal they are. As defined by the United States Geological Survey (USGS, a percentile is a value on a scale of one hundred that indicates the percent of a distribution that is equal to or below it. For example, a rainfall total that is calculated to be equivalent to the 90<sup>th</sup> percentile indicates that it is higher than 90 percent of the rainfall totals ever recorded for this month during all years that rainfall has been measured.

Percentiles for rainfall were calculated from the historical record by region, and by specific interval. The "wet season" total is the sum of the rainfall from June through September. The "dry season" total is the sum of the rainfall from October through May. The annual total characterization was calculated from a dataset of moving 12-month rainfall sum for the same period (1915 through the most recent completed year). The moving 12-month rainfall sum was used for annual statistics because it provided a much larger dataset, and therefore a better estimate of the true percentiles. The historical 12-month cumulative average is updated monthly.

Characterization ranges were established for each region, and for the whole District, with breaks at the 10<sup>th</sup> (P10), the 25<sup>th</sup> (P25), the 75<sup>th</sup> (P75) and the 90<sup>th</sup> (P90) percentiles. The normal range for rainfall is defined by totals that fall on or between the 25th to 75<sup>th</sup> percentiles of the historical monthly average for each region and where the 50<sup>th</sup> percentile represents the historical median. The zero percentile indicates a new period-of-record low and the 100th percentile is a new record high. The rainfall in inches for each percentile break, by rainfall interval and by region and the characterization ranges are summarized in the Appendix.

In March, rainfall totals were significantly above-normal in the northern counties of the District, while they were within the normal range in the central and southern counties. The normal range for rainfall is defined by totals that fall on or between the 25<sup>th</sup> to 75<sup>th</sup> percentiles of the historical monthly average for each region and where the 50<sup>th</sup> percentile represents the historical median. The northern counties received an average of 8.22 inches of rainfall, equivalent to the 96<sup>th</sup> percentile of the historical March record. The central counties received an average of 3.40 inches, equivalent to the 61<sup>st</sup> percentile of the historical March record, while the southern counties received an average of 1.43 inches, equivalent to the 35<sup>th</sup> percentile. District-wide, rainfall averaged 4.05 inches, which is equivalent to the 68<sup>th</sup> percentile.

During the 12-month period from April 1, 2021, through March 31, 2022, the average rainfall totals in the northern counties were classified as "wetter than normal," while totals in the central counties were classified as "normal" and totals in the southern counties were classified as "drier than normal." The northern counties received an average of 62.87 inches of rainfall, equivalent to the 90<sup>th</sup> percentile of the historical record. The

central counties received an average of 47.76 inches of rainfall, equivalent to the 32<sup>nd</sup> percentile. The southern counties received an average of 45.62 inches of rainfall, equivalent to the 24<sup>th</sup> percentile. The District-wide rainfall average was 51.19 inches, which is equivalent to the 43<sup>rd</sup> percentile of the historical annual record.

### **Tampa Monthly Climate Summary for March 2022**

According to the National Weather Service (NWS), the monthly average temperature (°F) for Tampa was 73.9 degrees, which was 5.3 degrees above normal. The highest temperature recorded during the month was 89.0 degrees, while the lowest temperature recorded during the month was 41.0 degrees. The March 2022 monthly average temperature of 73.9 degrees ties with 1997 as the 3<sup>rd</sup> warmest March since records began in 1890. The warmest March had an average temperature of 74.4 degrees, which occurred in 2012.

### **Temperature and Precipitation Outlook**

The Climate Prediction Center's (CPC) three-month weather forecast, as of April 21, 2022, indicates above-normal chances for rainfall throughout the District during the composite 3-month period from May through July 2022. The temperature forecast for this same time-period indicates above-normal temperatures throughout the District.

For more information log on to the CPC's website at:

http://www.cpc.ncep.noaa.gov/products/OUTLOOKS\_index.html

### RELATIONSHIP OF MARCH 2022 RAINFALL TO HISTORICAL RAINFALL AVERAGES

### SURFACE WATER

### Lakes

Across the District, 75 lakes have been selected as excellent indicators of current surface water conditions (see index map in Appendix). Water levels of these lakes are read monthly. In general, these lakes are concentrated in four regions, the northern region of Citrus, Hernando, and Sumter Counties, the Tampa Bay region of Hillsborough and Pasco Counties, the Polk Uplands region of northern Polk County, and the Lake Wales Ridge region of Polk and Highlands Counties. In this report, current monthly lake levels are tabulated and compared with previous records as well as District-established management levels. In addition, lake-level data representative of the four regions are presented in hydrographs showing a 15-year history of water levels, as a general indicator of surface-water conditions in that region.

The District's Governing Board (the Board) has established lake management levels for approximately 410 lakes within District boundaries, which are specified in Chapter 40D-8, Florida Administrative Code (F.A.C.). Management levels help protect the water resources of the District and the ecology of the lake or water-body for which it was established. In this report, the following three management levels are used to indicate normal and low lake levels: the Minimum Flood (MF) level, the Minimum Low Management (MLM) level, and the Minimum Extreme Low Management (MELM) level. In general, the MF level corresponds to the normal high level, the MLM to the normal low level, and the MELM to a drought-year low. These levels were derived from various sources, including technical publications, topographic maps, Water Resource Data Reports of the USGS, and other studies. Field investigations are also used to determine past surface levels from water marks, wetland vegetation, dry land vegetation, and to establish the elevation of septic tanks, docks, sea walls, roads and floor slabs.

During a normal year, each of the indicator lakes should reach both the designated normal high (MF) and the normal low (MLM) levels. In addition, it is generally beneficial for lakes to reach the adopted drought year low (MELM) level every four to six years for a short period of time for the biological health of the lake. In this report, hydrographs of representative lakes compare current and recent water levels against "normal ranges" defined by the adopted MF and MLM levels.

Of the 75 lakes presented in this report, 17 have water-control structures. These structures are used for water conservation and do not generally influence the water levels with regard to meteorologically wet or dry conditions. During periods of extreme high water, the structures may be operated to minimize flooding.

Compared to February data, 47 of the 75 lakes monitored for this report recorded water level decreases, while 25 recorded increases and three had no changes. Average water levels decreased in the Northern, Tampa Bay and Lake Wales Ridge regions by 0.01, 0.07 and 0.28 foot, respectively, while average levels increased slightly in the Polk Uplands region by 0.02 foot. District-wide, average water levels decreased by 0.06 foot, compared to last month.

Compared to March 2021 data, 45 of the 75 lakes monitored for this report recorded water level decreases, while 27 recorded increases and three had no changes. In the Northern region, average levels were 0.65 foot higher than last year's levels. In the Tampa Bay, Polk Uplands and Lake Wales Ridge regions, average levels were lower by 0.06, 0.82 and 0.90 foot, respectively. District-wide, average lake levels were lower by 0.22 foot, compared to last year's levels.

In March 2022, water levels in 57 of the 75 lakes were within the annual normal range, while 18 were below. Lake levels in the Northern, Tampa Bay and Polk Uplands regions averaged 0.00 foot, 0.65 foot and 1.15 feet, respectively, above the base of the annual normal range. Lake levels in the Lake Wales Ridge region averaged 0.49 foot below the base of the annual normal range. District-wide, average lake levels were 0.52 foot above the base of the annual normal range. Water levels in 71 of the 75 lakes were above the drought-year levels.

### 15-yr Period of Record

Monthly Mean Elevation

### 15-yr Period of Record

### 15-yr Period of Record

### **Streams**

The District processes streamflow data collected by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Streamflow is recorded daily as water elevations at 12 gauging stations in three regions of the District (see index map in the Appendix). The USGS uses rating curves developed from water level elevations to calculate streamflow discharge in units of cubic feet per second (cfs). For this report, the reported streamflow values are the means of the daily discharge volumes for the current month. The period-of-record high and low values correspond to monthly means and not to peak events. Percentile values are calculated from the monthly means for the period of record, for each station. The percentile is the monthly mean statistically ranked on a scale of zero to 100 that indicates the percent of the period-of-record monthly means that are at or above the present monthly median. The zero percentile indicates a new period-of-record low and the 100<sup>th</sup> percentile is a new record high level. The current year's data are provisional and are subject to revision. Revised data are used for all calculations, as they become available.

Hydrographs are produced for each of the stream stations. Current monthly means for each station are compared to respective 25<sup>th</sup> and 75<sup>th</sup> percentiles of the period-of-record monthly means, reflecting the normal range of readings for the month.

Compared to February data, eight of the 12 stations monitored for this report recorded decreased streamflow, while four recorded increases.

Compared to March 2021 data, ten of the 12 stations recorded streamflow decreases, while two recorded increases.

Compared to historical March discharge values. Withlacoochee River streamflow, measured at the Trilby station and the Holder station averaged in the 25th and 40<sup>th</sup> percentiles, respectively. Streamflow measured at the stations on the Anclote, Pithlachascotee and Hillsborough Rivers averaged in the 18th, 33rd and 38th percentiles of respective historical March readings. Streamflow measured at the Alafia River, Little Manatee River and Peace River at Bartow stations averaged in the 18th, 29th and 33<sup>rd</sup> percentiles of respective historical March readings. Additionally, streamflow measured at the Josephine Creek, Manatee River, Myakka River and Peace River at Arcadia stations averaged in the 33<sup>rd</sup>, 39<sup>th</sup>, 28<sup>th</sup> and 10<sup>th</sup> percentiles of respective historical March readings.

### **Springs**

The District processes springflow data collected by Tampa Bay Water through a mutual agreement and by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Springflow is monitored at six gauging stations in two regions of the District (see index map in the Appendix). Springflow data for Rainbow, Silver and Sulphur Springs are recorded as daily water levels. The USGS uses rating curves developed for these springs from historical water level elevations to calculate springflow discharge in units of cubic feet per second (cfs). Weeki Wachee Springs discharge (cfs) is provided as an instantaneous reading calculated by the USGS. Buckhorn and Lithia Springs discharge is obtained from Tampa Bay Water biweekly and weekly, respectively. Period-of-record high and low values correspond to monthly theoretical means and not to peak events. Values are reported as percentiles calculated from an analysis of historical monthly means recorded during a given month. The percentile is the monthly mean ranked on a scale of zero to 100, where the normal range is defined by flows between the 25th to 75th percentiles. The zero percentile indicates a new period-of-record low and the 100th percentile is a new record high. The values reported are provisional and are subject to revision at the end of the water year.

Compared to February data, all six stations monitored for this report recorded decreased springflow.

Compared to March 2021 data, three of the six stations recorded increased springflow, while three stations recorded decreased springflow.

Compared to historical period-of-record values for March, total springflow measured in Rainbow, Silver and Weeki Wachee Springs, in the northern region, was in the 61<sup>st</sup>, 29<sup>th</sup> and 68<sup>th</sup> percentiles, respectively, of historical March readings. Springflow measured in Sulphur, Buckhorn and Lithia Springs in the central region, was in the 5<sup>th</sup>, 25<sup>th</sup> and 70<sup>th</sup> percentiles, respectively, of historical March readings.

### **GROUNDWATER**

The groundwater section of this report provides groundwater level information for the Upper Floridan Aquifer (UFA) located within the District. As earlier indicated, the District is divided into three geographical regions defined by county boundaries (see index maps in the Appendix). In the northern counties, the UFA is generally at or near land surface, allowing rainfall to easily recharge (replenish) the aquifer system. In the central counties, the UFA can be unconfined or confined (overlain by thick clays). Where the UFA is confined, recharge to the aquifer from rainfall is low. In the southern counties, the UFA is confined.

Eighty-one UFA monitor wells are measured for this report to determine the relative health of groundwater levels District-wide. Only monitor wells with an adequate and reliable period-of-record of water level measurements were selected for the network. For each well, the 25<sup>th</sup> and 75<sup>th</sup> percentiles ("low normal" and "high normal," respectively) were calculated for each week of the year using the period-of-record data. The 25th and 75<sup>th</sup> percentiles are used to represent the lower and upper limits of the normal range, as they are considered a reliable and robust measure of the normal range and are less affected by extremes in the data record. The end-of month water-level readings measured for this report are compared to their corresponding normal ranges. Trend data from 16 wells are shown in hydrographs to compare current water levels to the low normal and high normal levels. Data from all 81 wells is further compiled into regional statistics for the three regions of the District. There are 20 wells located in the northern counties, 32 wells located in the central counties and 29 wells located in the southern counties, that are currently used for determining the regional percentiles. The potentiometric levels of representative Floridan aquifer wells are used to produce the potentiometric surface maps presented in this report.

### **Upper Floridan Aquifer**

Since February, 48 of the 81 wells monitored for this report recorded water level decreases, while 31 recorded increases. Water level data was unavailable for the SR 52 Deep W well located in the central counties and Edgeville 3 Deep well in the southern counties. Regionally, average water levels increased in the northern counties by 0.23 foot, while decreasing in the central and southern counties by 0.10 and 0.71 foot, respectively. District-wide, the average water level in the UFA decreased by 0.23 foot.

Compared to March 2021 data, 43 of the 81 wells monitored for this report recorded water level increases, while 37 recorded decreases. Water level data was unavailable for the SR 52 Deep W well. Regionally, the mean water level in the northern counties was higher by 1.80 feet, while it was lower in the central and southern counties by 0.58 and 0.90 foot, respectively. District-wide, average water levels in UFA wells were 0.10 foot lower than March 2021 levels.

In March, groundwater data showed that average regional levels in the UFA ended the month above-normal in the northern counties, while within the normal range in the central and southern counties. The groundwater level in the northern, central and southern counties ended the month at the 76<sup>th</sup>, 53<sup>rd</sup> and 47<sup>th</sup> percentiles, respectively.

In March, a "record high" monthly water level for the historic March readings was set in the ROMP TR 10-2 Tampa well, located in the central counties.

## SUMMARY OF UPPER FLORIDAN AQUIFER LEVELS IN REPRESENTATIVE WELLS, MARCH 2022

## **Regional Summary:**

#### **Regional Aquifer Resource Index**

Aquifers are underground layers of rock and sand that hold water. In southwest Florida, more than 80 percent of the water supply comes from aquifers. The Regional Aquifer Resource Index (ARI) was created to provide information to the media, residents, local governments and other interested parties about current groundwater conditions and how they compare to historical records. The underlying purpose of this index is to provide the public with a gauge of groundwater conditions in their area, so they can develop an understanding of the severity and cycles of drought and recovery.

This ARI report reflects percentile values to compare current aquifer levels to historical levels during the same time of year on a scale of 0-100. For example, if the regional groundwater level is at the 50th percentile, it means that half of the historical groundwater levels for this time of year were higher and half were lower than the current level.

To determine the ARI percentile value for each geographic region (indicated below), the percentile values of the monitor wells located within that region are averaged. Monitor wells with an adequate and reliable period-of-record to calculate weekly percentiles were selected for the network. A total of 81 wells District-wide are used for the ARI Network (see index map in Appendix).

#### **Weekly Aquifer Resource Index Level (Percentile)**

Report Date	Northern Counties	Central Counties	Southern Counties
03/02/2022	65	42	38
03/09/2022	66	41	33
03/16/2022	76	49	40
03/23/2022	76	51	44
03/30/2022	74	51	46

Note: Any regional percentile value that falls on or between the 25<sup>th</sup> and 75<sup>th</sup> percentile is considered "normal." Less than the 25<sup>th</sup> would be considered below-normal," while above the 75<sup>th</sup> would be considered "above-normal."

# REGIONAL AQUIFER RESOURCE INDEX March 2022

Groundwater Levels: Northern Counties

## Groundwater Levels: Southern Counties

#### Reservoirs

Water-level data for the seven reservoirs are obtained weekly from the USGS, Manatee County Utilities Department, Peace River/Manasota Regional Water Supply Authority, or Tampa Bay Water. The last weekly water-level value of the month is indicated in this report. The values reported are provisional and subject to revision.

In March, five of the seven reservoirs monitored for this report recorded water-level decreases, while two recorded increases, compared to last month. The Evers, Bill Young, Peace River Nos. 1 and 2, and Shell Creek reservoirs posted water level decreases of 0.04 foot, 3.61 feet, 0.50 foot and 3.80 feet, and 0.05 foot, respectively. The Hillsborough River and Lake Manatee reservoirs posted water level increases of 0.23 and 0.06 foot, respectively, compared to last month.

## SUMMARY OF WATER LEVELS IN WATER SUPPLY RESERVOIRS (GAGE LEVEL, IN FEET)

				Change	Change

#### **STREAM MONITORING STATIONS**

WITHLACOOCHEE RIVER (Northern Region)

Total length: 157 miles

Headwaters: NW Polk and southern Sumter Counties

Elevation: 135 feet

Tributaries: Little Withlacoochee, Big Gant Canal, Jumper Creek, Shady

Brook, Outlet River of Lake Panasoffkee, Leslie Heifner Canal, Orange State Canal, Tsala Apopka Outfall Canal and Rainbow

Springs.

Mouth: Gulf of Mexico, Citrus County

Drainage area: 2000 square miles

**Holder Station** 

County: Marion Period-of-record: 1928

Location: 38 miles upstream from mouth

Drainage area: 1825 square miles

**Trilby Station** 

County: Hernando Period-of-record: 1928

Location: 93 miles upstream from mouth

Drainage area: 570 square miles

**ANCLOTE RIVER (Central Region)** 

Total length: 27.5 miles

Headwaters: South-central Pasco County, west of Land O Lakes

Elevation: 65 feet

Tributaries: South Branch and Hollin Creek Mouth: South Branch and Hollin Creek Gulf of Mexico, Pasco County

Drainage area: 113 square miles

**Elfers Station** 

County: Pasco Period-of-record: 1946

Location: 16 miles upstream from mouth

Drainage area: 72.5 square miles

**HILLSBOROUGH RIVER (Central Region)** 

Total length: 55 miles

Headwaters: Southeast Pasco County

Elevation: 77 feet

Tributaries: Crystal Springs, Blackwater Creek, Flint Creek, Trout Creek,

Cypress Creek, Curiosity Creek and Sulphur Springs

Mouth: Hillsborough Bay Drainage area: 690 square miles

**Zephyrhills Station** 

County: Hillsborough

Period-of-record: 1939

Location: 40 miles upstream from mouth

Drainage area: 200 square miles

#### PITHLACHASCOTEE RIVER (Central Region)

Total length: 41 miles

Headwaters: Crews Lake and Masaryktown area in central Pasco and

southern Hernando Counties

Elevation: 120 feet
Mouth: Gulf of Mexico
Drainage area: 191 square miles

#### **New Port Richey Station:**

County: Pasco Period-of-record: 1963

Location: 10.5 miles upstream from mouth

Drainage area: 180 square miles

#### **ALAFIA RIVER (Central Region)**

Total length: 24 miles

Headwaters: Western Polk and eastern Hillsborough Counties

Tributaries: North and South Prongs, Lithia Springs, and Buckhorn Creek.

Elevation: 30 feet
Mouth: Tampa Bay
Drainage area: 420 square miles

#### **Lithia Station:**

County: Hillsborough

Period-of-record: 1932

Location: 16 miles upstream from mouth

Drainage area: 335 square miles

#### LITTLE MANATEE RIVER (Central Region)

Total length: 39 miles

Headwaters: Southeast Hillsborough County

Tributaries: Carlton Branch, the South Fork, Dug Creek and Cypress Creek.

Elevation: 130 feet
Mouth: Tampa Bay
Drainage area: 225 square miles

#### **Wimauma Station:**

County: Hillsborough

Period-of-record: 1939

Location: 15 miles upstream from mouth

Drainage area: 149 square miles

#### **JOSEPHINE CREEK (Southern Region)**

Total length: 12 miles

Headwaters: Lake Josephine in central Highlands County

Elevation: 80 feet

Mouth: Lake Istokpoga in Highlands County

Drainage area: 143 square miles

#### **DeSoto City Station:**

County: Highlands Period-of-record: 1946

Location: 4.9 miles upstream of mouth

Drainage area: 109 square miles

#### **MANATEE RIVER (Southern Region)**

Total length: 45 miles

Headwaters: Four corners area Hillsborough, Polk, Hardee and manatee Counties.

Elevation: 130 feet
Mouth: Tampa Bay
Drainage area: 330 square miles

#### Myakka Head Station:

County: Manatee Period-of-record: 1966

Location: 36 miles upstream from mouth

Drainage area: 65.3 square miles

#### **MYAKKA RIVER (Southern Region)**

Total length: 54.1 miles

Headwaters: Western Hardee and Eastern Manatee Counties Tributaries: Howard Creek, Deer Prairie, and Big Slough Canal

Elevation: 105 feet

Mouth: Charlotte Harbor Drainage area: 540 square miles

#### **Sarasota Station:**

County: Sarasota Period-of-record: 1936

Location: 36 miles upstream from mouth

Drainage area: 229 square miles

#### **PEACE RIVER (Central and Southern Region)**

Total length: 120 miles

Headwaters: Green Swamp in northern Polk County through Lake Hancock, Winter Haven

chain of lakes, and Lake Hamilton.

Tributaries: Peace Creek Canal, Saddle Creek, Charlie Creek, Prairie Creek, Horse Creek,

Joshua Creek and Shell Creek. Elevation: 110 feet

Mouth: Charlotte Harbor Drainage area: 2300 square miles

#### **Arcadia Station (Southern Region):**

County: Desoto Period-of-record: 1931

Location: 36 miles upstream from mouth

Drainage area: 1367 square miles

#### **Bartow Station (Central Region):**

County: Polk Period-of-record: 1939

Location: 105 miles upstream from mouth

Drainage area: 390 square miles

## Selected Spring Monitoring Stations

<u>Map ID</u>	<u>Site Name</u>
1	Lithia Main Spring
2	Buckhorn Main Spring
3	Sulphur Springs at Sulphur Springs
5	Weeki Wachee River near Brooksville
6	Rainbow Springs near Dunnellon
7	Silver Springs near Ocala

#### **SPRINGS MONITORING STATIONS**

**RAINBOW SPRINGS (Northern Region)** 

County: Marion

Basin: Withlacoochee River

Magnitude: 1st

Discharge measurement location: 5 mi downstream from head of springs Discharge contributes to: Rainbow River, Withlacoochee River

Public Access: Yes Period-of-record: 1965

Gage: Non-recording gage

**SILVER SPRINGS (Northern Region)** 

County: Marion

Basin: Ocklawaha River

1<sup>st</sup> Magnitude:

Discharge measurement location: 4 to 5 mi downstream from head of springs Discharge contributes to:

Silver Springs River, Ocklawaha River,

St. Johns River

Public Access: Yes 1932 Period-of-record:

Water-stage recorder Gage:

**WEEKI WACHEE SPRINGS (Northern Region)** 

County: Hernando Basin: Coastal Rivers

Magnitude: 1st

Discharge measurement location: 1 mi downstream from head of springs

Discharge contributes to: Weeki Wachee River

Public Access: Yes Period-of-record: 1993

Gage: Water-stage

**SULPHUR SPRINGS (Central Region)** 

County: Hillsborough Basin: Hillsborough River

Magnitude:

Discharge measurement location: 300 ft downstream from gage

Discharge contributes to: Hillsborough River

Public Access: Yes 1956 Period-of-record:

Gage: Water-stage recorder

#### **BUCKHORN SPRINGS (Central Region)**

County: Hillsborough Basin: Alafia River

Magnitude: 2<sup>nd</sup>

Discharge measurement location: Difference between discharge measurements

of Buckhorn Creek made  $2\bar{5}$  ft upstream from and 100 ft downstream from Buckhorn Springs

Discharge contributes to: Buckhorn Creek, Alafia River

Public Access: No Period-of-record: 1987

Gage: Water-stage recorder

#### LITHIA SPRINGS: (Central Region)

County: Hillsborough Basin: Alafia River

Magnitude: 2<sup>nd</sup>

Discharge measurement location: 50 feet downstream from main pool

Discharge contributes to: Alafia River

Public Access: Yes Period-of-record: 1934

Gage: Water-stage recorder

# DESCRIPTION OF PUBLIC SUPPLY SURFACE WATER RESERVOIRS

CITY OF TAMPA RESERVOIR (Hillsborough River Basin): Constructed in 1924, it is located on the Hillsborough River in Hillsborough County. It is the fourth largest public supply surface water facility in the District. It is the main water supply for the City of Tampa and has a total storage capacity of 1.7 billion gallons (bg). The total usable volume is 1.4 bg, when the reservoir elevation is 22.5 feet NGVD. It is an in-stream reservoir with a depth that ranges between nine and 22 feet. Given this amount of water, it is estimated that a 15-day supply of water is available from this facility over an extended dry period. During periods of low water due to drought conditions, the facility is permitted to pump water from two alternate sources. The first of these two sources is the Tampa Bypass Canal. Water is pumped over the water control structure at S-161 into the Hillsborough River above the dam. The second source is Sulphur Springs, just downstream from the dam, where water is captured at the spring and pumped back behind the dam. Withdrawals from both sources are in strict accordance with pumpage schedules as outlined in the facility's water use permit. When water levels fall below 12 feet NGVD, water cannot be withdrawn because the reservoir level is below the intake pipes. The permitted average daily withdrawal for this facility is 82 mgd, with a permitted maximum daily withdrawal of 104 mgd. Currently, ground water wells are not used to augment this facility. The minimum producible level is 9.00 feet.

#### PEACE RIVER RESERVOIRS - PEACE RIVER/MANASOTA REGIONAL WATER

**SUPPLY AUTHORITY (Peace River Basin):** The Peace River reservoirs are located in southwestern DeSoto County. They are an off-stream reservoir system consisting of two reservoirs that store surface water captured from the Peace River during wet periods. The first reservoir, Reservoir 1, was built in 1980 and encompasses approximately 85 acres, has a water depth of approximately 31 feet, and has a total storage capacity of approximately 625 million gallons. The second reservoir, Reservoir 2, was built in 2009, covers about 616 acres, has a water depth of approximately 35 feet, and has a total storage capacity of about 6.0 billion gallons. The PRMRWSA facility ranks as the third largest in the District for total volume storage and supplies water to Charlotte, DeSoto, Manatee and Sarasota counties and to the City of North Port. The facility also uses an aquifer storage recovery (ASR) system for storing treated water pumped from the river. The minimum producible level at Reservoir 1 is Elevation 8.0 feet, while Reservoir 2 is Elevation 27.0 feet.

MANATEE RESERVOIR (Manasota Basin): Completed in 1967 by the damming of the Manatee River, the Manatee Reservoir is the second largest of the six surface-water public supply facilities within the District. Located in Manatee County, this in-stream facility has a storage capacity of 7.5 bg. The service area of the Manatee reservoir is the unincorporated portions of Manatee County, the City of Palmetto and Anna Maria Island, and also the Sarasota SUD#1. This reservoir provides essentially all public supply for Manatee County, with the exception of the City of Bradenton. The total size of this reservoir is 1800 acres with an average depth of 15 feet. With the reservoir full, the

facility has approximately 220 days of available water supply. When the surface-water elevation drops below 21.0 feet, water cannot be withdrawn because levels are below the facility's intakes. The permitted average daily withdrawal for this facility is 34.9 mgd, with a permitted peak monthly quantity of 41.9 mgd. The minimum producible level is 21.00 feet.

**EVERS RESERVOIR (Manasota Basin):** Constructed in 1935 and expanded in 1985, it is located on the Braden River in Manatee County. This is the fifth largest public supply reservoir in the District. Its main service area is the City of Bradenton and approximately 500 customers outside the city. It has a total storage capacity of 1.5 bg. The total size of the facility is 300 acres with an average depth of 12 feet. Water ceases to flow over the dam when the level falls below 3.84 feet NGVD. During the 1985 drought, while expansion of the facility was taking place, the water level dropped to one foot below sea level and demand was still met. Given a completely full reservoir, with no water going over the spillway, it is estimated the facility could supply water for approximately 260 days, with no input from rainfall. The permitted average daily withdrawal for this facility is 6.95 mgd, with a permitted peak monthly quantity of 8.13 mgd. Currently, ground-water wells are not used to augment this facility.

SHELL CREEK RESERVOIR (Peace River Basin): Shell Creek Reservoir, located in Charlotte County, is the sixth largest surface water system within the District. This system was built in 1964 and services the City of Punta Gorda as well as unincorporated areas surrounding the city limits. The Shell Creek Reservoir is fed by two primary tributaries, Shell Creek from the east and Prairie Creek from the northwest. The total drainage area at Hendrickson Dam is 373 square miles. It has a surface area of 800 acres and depths of 10 to 12 feet. Total storage capacity is 765 mg. Even with this low volume of water, personnel at this facility estimate they have approximately 125 days of available supply with no input from rainfall. Water ceases to flow across the weir when surface elevations drop below 5.0 feet NGVD, and at 3.7 feet NGVD water quality becomes a major concern. When surface elevations drop below 1.75 feet NGVD, the water is below the intakes and withdrawal of water is not possible. The permitted average daily withdrawal by this facility is 5.358 mgd, with a permitted peak monthly quantity of 6.901 mgd. The minimum producible level is 1.70 feet.

C.W. BILL YOUNG REGIONAL RESERVOIR - TAMPA BAY WATER (Alafia River Basin): Constructed in early 2005, it is the largest public supply surface water facility in the District. Located in southern Hillsborough County, it is an off-stream reservoir that stores surface water skimmed from the Tampa Bypass Canal and Alafia and Hillsborough Rivers. It services the Tampa Bay region through the Tampa Bay Water regional public supply water distribution system. The reservoir has an estimated storage capacity of 15.0 bg when the water level elevation is 136.5 feet NGVD. The reservoir is approximately 45 feet deep, two miles long and one mile wide, and encompasses a land area of approximately 1,100 acres. It reportedly has the capacity to provide 25 percent of the Tampa Bay region's public supply needs for six months and can supply the Tampa Bay regional surface water treatment plant at full capacity for 227 days.
