TABLE OF CONTENTS

ACKNOWLEDGMENTS

The Hydrologic Conditions Report is a monthly effort of the Operation's Department Hydrologic Data Section. Acknowledgment is made to the following staff for their significant contributions, hard work and dedication to the timely production of this report:

Data Collection:	Terry Burrell, Dave Dunnett, Don Everson, George Prine, Steve Saxon, Larry Rivenbark, James Ferrell, Jeff Taylor, and Everett Eldridge.
SCADA System:	Mike Katherina.
QA/QC and Reporting:	Margit Crowell, Pam Green, Ken Romie, Steve DeSmith, and Tammy Plazak.
Administrative Support/ Document Preparation:	Della Haberle and Susie Holton.

INTRODUCTION

The Hydrologic Conditions Report is generated monthly by the Hydrologic Data Section, Operations Department, of the Southwest Florida Water Management District. This report provides an end-of-month analytical summary of regional and temporal variations in the hydrologic conditions across the District's 16-county area for planning and regulatory purposes. In addition, it provides an excellent historical record for long-term local and regional hydrologic analysis.

The Hydrologic Data Section is responsible for the implementation and maintenance of a network of observation and monitoring stations used to track changes in various hydrologic parameters over time. Data collected are used by the regulatory, technical, and analytical sections of the District. Data recently collected and maintained by the section include: station and basin rainfall totals, stream and spring discharge measurements, and surface and ground water levels. Frequency of data collection ranges from hourly to monthly readings. All data collected are processed and analyzed, then uploaded into the Water Management Data Base for general access by the District. The Water Management Data Base is also periodically augmented from the United States Geological Survey's hydrologic data network.

The data presented in this report are monthly rainfall totals, streamflow, springflow, surface and ground water levels, reservoir levels and the Aquifer Resource Index. Associated maps of station locations are at the end of the report in the Appendices. Also reported herein are levels of public supply surface water reservoirs supplemented by various regional utilities. The data contained in this report was collected and analyzed in accordance with generally accepted procedures consistent with applicable scientific and technical standards of practice. The data presented are considered to be the best available at the time of publication and are subject to revision. Any questions about the significance, accuracy, or interpretation of these data should be referred to Granville Kinsman, Manager of the Hydrologic Data Section at (352) 796-7211 or (800) 423-1476, extension 4284.

The data evaluation, analyses and interpretation contained within this report have been prepared or approved by a certified Professional Geologist in accordance with Chapter 492, Florida Statutes.

Steven W. DeSmith 06/18/2009

Americans with Disabilities Act (ADA)

The Southwest Florida Water Management District (District) does not discriminate on the basis of disability. This nondiscrimination policy involves every aspect of the District's functions, including access to and participation in the District's programs and activities. Anyone requiring reasonable accommodation as provided for in the Americans with Disabilities Act should contact the District's Human Resources Director, 2379 Broad Street, Brooksville, Florida 34604-6899; telephone (352) 796-7211, ext. 4702 or 1-800-423-1476 (FL only), ext. 4702; TDD (FL only) 1-800-231-6103; or email to ADACoordinator@swfwmd.state.fl.us.

EXECUTIVE SUMMARY

Provisional Hydrologic Conditions as of June 16, 2009

Provisional rainfall totals are provided for the period of June 1, 2009 through June 16, 2009. The northern region has received an average of 2.54 inches, while the historic mean for the month of June is 7.47 inches. The central region has received an average of 1.89 inches, while the historic mean for the central region for June is 6.98 inches. The southern region has received 3.23 inches, while the historic mean for the southern region for June is 7.95 inches.

Provisional lake level data indicate that during the first 15 days of June, water levels have increased in the northern region and decreased in the Tampa Bay, Polk Uplands, and Lake Wales Ridge regions of the District. Average lake levels in the Northern region increased an average of 0.26 foot and were 5.0 feet below the base of the normal range. Lake levels in the Tampa Bay region decreased an average of 0.03 foot and were 2.54 feet below the base of the normal range. Lake levels in the Polk Uplands region decreased 0.06 foot and were 2.41 feet below the base of the normal range. The Lake Wales Ridge region posted an average decrease of 0.05 foot and was 4.98 feet below the base of the normal range.

As of June 16, 2009, average streamflow increased in all three regions of the District compared to last month's data from regional index streams. The average streamflow for the Withlacoochee River near Holder in the northern region was normal at the 32nd percentile. The average streamflow measured at the Hillsborough River near Zephyrhills in the central region was normal at the 65th percentile, and the Peace River at Arcadia in the southern region was normal at the 53rd percentile.

Provisional groundwater data derived from the Aquifer Resource Index, as of June 15, 2009, indicate that average water levels increased in all three regions of the District. Water levels increased an average of 0.21 foot in the northern counties and were 0.52 foot above the bottom of the normal range. Water levels increased an average of 1.56 feet in the central counties and were 2.06 feet above the bottom of the normal range. Water levels increased an average of 4.49 feet in the southern counties and were 3.68 feet above the bottom of the normal range.

EXECUTIVE SUMMARY

Hydrologic Conditions for May 2009

In May, average rainfall totals for all three regions of the District were above-normal. The normal range for rainfall is defined by totals that fall on or between the 25th to 75th percentiles of the historical monthly accumulation for each region and where the 50th percentile represents the historical median. The northern region received an average of 11.10 inches of rainfall, equivalent to the 98th percentile of the historical May record. The central region received an average of 10.57 inches of rainfall, equivalent to the 98th percentile of the historical May record. The southern region received an average of 7.68 inches of rainfall, equivalent to the 97th percentile. The District-wide rainfall average of 9.68 inches was equivalent to the 98th percentile of the historical May record.

During the eight-month “dry season,” the period from October 1, 2008 through May 31, 2009, rainfall totals for the northern and central regions of the District were within the normal range, while the southern region was below-normal. The northern region received an average of 21.02 inches of rainfall, which was 2.43 inches below the historical "dry season" mean rainfall of 23.45 inches. This rainfall average was equivalent to the 42nd percentile of historical "dry season" mean rainfall and is classified as "normal." The central region received an average of 20.15 inches of rainfall, which was 1.62 inches below the historical mean of 21.77 inches. This rainfall average was equivalent to the 44th percentile of the historical "dry season" mean rainfall and is classified as "normal." The southern region received an average rainfall accumulation of 15.73 inches, which was 5.11 inches below the historical mean of 20.84 inches. This rainfall average was equivalent to the 24th percentile of the historical "dry season" mean rainfall and is classified as "drier than normal." District-wide, the “dry season” average rainfall was 18.81 inches, which was 3.08 inches below the historical "dry season" mean rainfall of 21.89 inches. This rainfall average was equivalent to the 39th percentile of the historical "dry season" mean rainfall and is classified as "normal."

During the 12-month period from June 1, 2008 through May 31, 2009, the average rainfall totals in all three regions of the District were classified as "normal." The northern region received an average of 52.50 inches of rainfall, equivalent to the 43rd percentile of the historical record. The central region received an average of 46.68 inches of rainfall, equivalent to the 27th percentile. The southern region received an average of 47.54 inches of rainfall, equivalent to the 30th percentile. The District-wide rainfall average of 48.53 inches was equivalent to the 31st percentile of the historical annual record.

Average lake levels in May were below the annual normal range in all regions of the District. Normal lake levels are defined as levels that fall between the minimum low management level and the minimum flood level. Lake levels in the northern region increased by an average of 0.77 foot and were 5.26 feet below the base of the annual normal range. Lake levels in the Tampa Bay region increased an average of 0.34 foot and were 2.51 feet below the base of the annual normal range. Lake levels in the Polk Uplands region increased 0.37 foot and were 2.35 feet below the base of the annual normal range. Average lake levels in the Lake Wales Ridge region increased 0.03 foot and ended the month 4.93 feet below the base of the annual normal range.

Total streamflow in regional index streams, in May, was below-normal in the northern region of the District, while it was above-normal in the central and southern regions. Normal streamflow is defined as falling between the 25th and 75th percentiles. Streamflow measured at the Withlacoochee River near Holder station in the northern region was in the 14th percentile. Streamflow in the Hillsborough River near Zephyrhills station in the central region was in the 95th percentile, while total streamflow measured at the Peace River at Arcadia station in the southern region was in the 76th percentile during May.

In May, groundwater data showed that levels in the intermediate and Floridan aquifers were within the normal range in all three regions of the District. The normal range is defined as between the 25th and 75th percentiles. The groundwater level in the northern region was in the 27th percentile, while levels in the central and southern regions were both in the 31st percentile.

REGIONAL OVERVIEW OF HYDROLOGIC CONDITIONS

MAY 2009

Northern Region

In May, the northern region received an average of 11.10 inches of rainfall, equivalent to the 98th percentile of the historical May readings, which is considered "very wet." Average lake levels increased in the northern region and ended the month an average of 5.26 feet below the base of the annual normal range. Total streamflow measured in the Withlacoochee River near Holder station increased and was in the 14th percentile. Regional groundwater levels indicated average surficial aquifer water levels increased and were in the 56th percentile; while levels in the intermediate and Floridan aquifer increased and were in the 27th percentile.

Central Region

In May, the central region received an average of 10.57 inches of rainfall, equivalent to the 98th percentile of historical May readings, which is considered "very wet." Average lake levels increased in the Tampa Bay and Polk Uplands regions and ended the month 2.51 and 2.35 feet, respectively, below the base of the annual range. Total streamflow measured at the Hillsborough River near Zephyrhills station increased and was in the 95th percentile. Regional groundwater levels indicated average surficial aquifer water levels increased and were in the 35th percentile; while levels in the intermediate and Floridan aquifer increased and were in the 31st percentile.

Southern Region

In May, the southern region received an average of 7.68 inches of rainfall, equivalent to the 97th percentile of historical May readings, which is considered "very wet." Average lake levels increased in the Lake Wales Ridge region and ended the month 4.93 feet below the base of the annual normal range. Total streamflow measured at the Peace River at Arcadia station increased and was in the 76th percentile. Regional groundwater levels indicated average surficial aquifer water levels increased and were in the 35th percentile; while levels in the intermediate and Floridan aquifer increased and were in the 31st percentile.

RAINFALL

The rainfall data used for all tabulations in this report are provided to the District under contract with an external vendor. These data are created by enhancing contractor-developed NEXRAD radar rainfall imagery with hourly rainfall data collected from the District's network of real-time gauges. This process results in highly accurate cell-based rainfall data representative of conditions over the entire District, including those portions where rainfall data collection would otherwise be limited due to gaps in the gauging network.

As defined by the United States Geological Survey (USGS), a percentile is a value on a scale of one hundred that indicates the percent of a distribution that is equal to or below it. For example, a rainfall total equivalent to the 90th percentile is equal to or greater than 90 percent of the rainfall totals recorded for this month during all years that totals have been recorded.

Percentiles for rainfall were calculated from the historical record by region, and by specific interval. The "wet season" total is the sum of the rainfall from June through September. The "dry season" total is the sum of the rainfall from October through May. The annual total characterization was calculated from a dataset of moving 12-month rainfall sum for the same period (1915 through the most recent completed year). The moving 12-month rainfall sum was used for annual statistics because it provided a much larger dataset, and therefore a better estimate of the true percentiles. The historical 12-month cumulative average is updated monthly.

Characterization ranges were established for each region, and for the whole District, with breaks at the 10th (P10), the 25th (P25), the 75th (P75) and the 90th (P90) percentiles. The rainfall in inches for each percentile break, by rainfall interval and by region and the characterization ranges are summarized in the Appendix.

In May, rainfall totals for all three regions of the District were above-normal. The normal range for rainfall is defined by totals that fall on or between the 25th to 75th percentiles of the historical monthly average for each region and where the 50th percentile represents the historical median. The northern region received an average of 11.10 inches of rainfall, equivalent to the 98th percentile of the historical record. The central region received an average of 10.57 inches, equivalent to the 98th percentile; while the southern region received an average of 7.68 inches, equivalent to the 97th percentile. District-wide, rainfall averaged 9.68 inches, which is equivalent to the 98th percentile of the historical May record.

During the eight-month “dry season,” the period from October 1, 2008 through May 31, 2009, rainfall totals for the northern and central regions of the District were normal, while the southern region was below-normal. The northern region received an average of 21.02 inches of rainfall, which was 2.43 inches below the historical "dry season" mean rainfall of 23.45 inches. This rainfall average was equivalent to the 42nd percentile of historical "dry season" mean rainfall and is classified as "normal." The central region received an average of 20.15 inches of rainfall, which was 1.62 inches below the historical mean of 21.77 inches. This rainfall average was equivalent to the 44th percentile of the historical "dry season" mean rainfall and is classified as "normal." The southern region received an average rainfall accumulation of 15.73 inches, which was 5.11 inches below the historical mean of

20.84 inches. This rainfall average was equivalent to the 24th percentile of the historical "dry season" mean rainfall and is classified as "drier than normal." District-wide, the “dry season” average rainfall was 18.81inches, which was 3.08 inches below the historical "dry season" mean rainfall of 21.89 inches. This rainfall average was equivalent to the 39th percentile of the historical "dry season" mean rainfall and is classified as "normal."

During the 12-month period from June 1, 2008 through May 31, 2009, the average rainfall totals in all three regions of the District were classified as “normal.” The northern region received an average of 52.50 inches of rainfall, equivalent to the 43rd percentile of the historical record. The central region received an average of 46.68 inches of rainfall, equivalent to the 27th percentile. The southern region received an average of 47.54 inches of rainfall, equivalent to the 30th percentile. The District-wide rainfall average was 48.53 inches, which is equivalent to the 31st percentile of the historical annual record.

Tampa Monthly Climate Summary for May 2009

According to the National Weather Service (NWS), the monthly average temperature (°F) in the Tampa Bay area (TBA) was 78.7 degrees, which was 1.1 degree above normal. The highest temperature recorded in the TBA during the month was 94 degrees, while the lowest temperature recorded during the month was 65 degrees. Rainfall in the TBA ranks as the third wettest May since records began in 1890. The wettest May on record has 17.64 inches of rain which occurred in 1979.

Temperature and Precipitation Outlook

The Climate Prediction Center's (CPC) three-month weather forecast, as of June 18, 2009, indicates above-normal precipitation and above-normal temperatures for all three regions of the District during the three-month period of July/August/September 2009.

Southwest Florida Water Management District

SURFACE WATER

Lakes

Across the District, 76 lakes have been selected as excellent indicators of current surface water conditions (see index map in Appendix). Water levels of these lakes are read monthly. In general, these lakes are concentrated in four regions, the northern region of Citrus, Hernando, and Sumter Counties, the Tampa Bay region of Hillsborough and Pasco Counties, the Polk Uplands region of northern Polk County, and the Lake Wales Ridge region of Polk and Highlands Counties. In this report, current monthly lake levels are tabulated and compared with previous records as well as District-established management levels. In addition, lake-level data representative of the four regions are presented in hydrographs showing a 15-year history of water levels, as a general indicator of surface-water conditions in that region.

The District's Governing Board (the Board) has established lake management levels for approximately 410 lakes within District boundaries, which are specified in Chapter 40D-8, Florida Administrative Code (F.A.C.). Management levels help protect the water resources of the District and the ecology of the lake or water-body for which it was established. In this report, the following three management levels are used to indicate normal and low lake levels: the Minimum Flood (MF) level, the Minimum Low Management (MLM) level, and the Minimum Extreme Low Management (MELM) level. In general, the MF level corresponds to the normal high level, the MLM to the normal low level, and the MELM to a drought-year low. These levels were derived from various sources, including technical publications, topographic maps, Water Resource Data Reports of the USGS, and other studies. Field investigations are also used to determine past surface levels from water marks, wetland vegetation, dry land vegetation, and to establish the elevation of septic tanks, docks, sea walls, roads and floor slabs.

During a normal year, each of the indicator lakes should reach both the designated normal high (MF) and the normal low (MLM) levels. In addition, it is generally beneficial for lakes to reach the adopted drought year low (MELM) level every four to six years for a short period of time for the biological health of the lake. In this report, hydrographs of representative lakes compare current and recent water levels against **"normal ranges"** defined by the adopted MF and MLM levels.

Of the 76 lakes presented in this report, 17 have water-control structures. These structures are used for water conservation and do not generally influence the water levels with regard to meteorologically wet or dry conditions. During periods of extreme high water, the structures may be operated to minimize flooding.

In May, 65 of the 76 lakes monitored for this report recorded water level increases. Water levels increased in the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions by 0.77, 0.34, 0.37 and 0.03 foot, respectively. District-wide, average water levels increased by 0.40 foot, compared to last month.

In May, average water levels were lower in 52 of the 76 lakes, compared to May 2008. In the Northern, Tampa Bay and Polk Uplands regions, the average regional lake level was lower by 0.82, 0.44 and 0.06 foot, respectively, compared to last year's levels. In the Lake Wales Ridge region, water levels increased by 0.67 foot. District-wide, average lake levels were lower by 0.29 foot.

Water levels in 69 of the 76 lakes were below the base of the annual normal range. Average lake levels in the Northern and Tampa Bay regions were 5.26 and 2.51 feet, respectively, below the base of the annual normal range. Water levels in the Polk Uplands and Lake Wales Ridge regions were 2.35 and 4.93 feet, respectively, below the base of the annual normal range. District-wide, average lake levels were 3.30 feet below the base of the annual normal range. Water levels in 48 of the 76 lakes were below the drought-year levels.

Period-of-record low water levels were recorded at three of the 76 lakes in May 2009. These Lakes were Lakes Iola and Lindsey in the Northern Region and Lake Gibson in the Polk Uplands Region. The low levels occurred between May 10 and 11, but with the substantial rains occurring mid-month, water levels rose at these lakes through the end of the month.

Streams

The District processes streamflow data collected by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Streamflow is recorded daily as water elevations at 12 gauging stations in three regions of the District (see index map in the Appendix). The USGS uses rating curves developed from water level elevations to calculate streamflow discharge in units of cubic feet per second (cfs). For this report, the reported streamflow values are the means of the daily discharge volumes for the current month. The period-of-record high and low values correspond to monthly means and not to peak events. Percentile values are calculated from the monthly means for the period of record, for each station. The percentile is the monthly mean statistically ranked on a scale of zero to 100 that indicates the percent of the period-of-record monthly means that are at or above the present monthly mean. The current year's data are provisional, and are subject to revision. Revised data are used for all calculations, as they become available.

Hydrographs are produced for each of the stream stations. Current monthly means for each station are compared to respective 25th and 75th percentiles of the period-of-record monthly means.

In May, ten of the twelve stations monitored for this report had increased streamflow compared to last month. Total streamflow increased in the northern, central and southern regions of the District by 59.0 cfs (38.1 mgd), 453.0 cfs (292.6 mgd) and 494.0 cfs (319.1 mgd), respectively. District-wide, total streamflow increased an average of 1006.0 cfs (649.9 mgd).

Eight of the twelve monitoring stations recorded higher streamflow in May 2009 than in May 2008. Streamflow was higher in the northern, central and southern regions by 34.7 cfs (22.4 mgd), 401.5 cfs (259.4 mgd) and 455.4 cfs (294.2), respectively. District-wide, total streamflow was higher, on average, by 891.6 cfs (576.0 mgd), than the May 2008 average.

Compared to historical May discharge values, Withlacoochee River streamflow, measured at the Trilby station and the Holder station averaged in the 15th and 14th percentiles, respectively. Streamflow measured at the Anclote, Pithlachascotee River, and Hillsborough River stations averaged in the 3rd, 23rd and 95th percentiles of respective historical May readings. Streamflow measured at the Alafia River, Little Manatee River and Peace River at Bartow stations averaged in the 88th, 90th and 44th percentiles of respective historical May readings. Additionally, streamflow measured at the Josephine Creek, Manatee River, Myakka River and Peace River at Arcadia stations averaged in the 45th, 95th, 55th and 76th percentiles of respective historical May readings.

Springs

The District processes springflow data collected by Tampa Bay Water through a mutual agreement and by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Springflow is monitored at seven gauging stations in three regions of the District (see index map in the Appendix). Springflow data for Rainbow, Silver and Sulphur Springs are recorded as daily water levels. The USGS uses rating curves developed for these springs from historical water level elevations to calculate springflow discharge in units of cubic feet per second (cfs). Crystal and Weeki Wachee Springs discharge (cfs) is provided as an instantaneous reading calculated by the USGS. Buckhorn and Lithia Springs discharge is obtained from Tampa Bay Water biweekly and weekly, respectively. Period-of-record high and low values correspond to monthly theoretical means and not to peak events. Values are reported as percentiles calculated from an analysis of historical monthly means recorded during a given month. The percentile is the monthly mean ranked on a scale of zero to 100 that indicates the percent of period-of-record values that are above, equal to or below the median (50^{th} percentile) for the current month. The values reported are provisional, and are subject to revision at the end of the water year. Revised USGS springflow data are loaded into the District's WMDB when they become available.

Hydrographs are produced for the seven-springflow stations, and current values are compared to respective 25^{th} and 75^{th} percentiles that are calculated from historical data. The 25^{th} and 75^{th} percentiles are calculated using the SAS™ software system for data analysis using period-of-record monthly theoretical means for each springflow station analyzed.

In May, five of the seven stations reported increased springflow, compared to the previous month. Total springflow increased in the northern and central regions of the District by 83.0 cfs (53.6 mgd) and 21.6 cfs (13.9 mgd). District-wide, springflow increased by 104.6 cfs (67.6 mgd).

Total springflow recorded in five of the seven stations was higher in May 2009 than May 2008. Total springflow for the northern and central regions was lower by 6.0 cfs (3.8 mgd) and 3.7 cfs (2.4 mgd), respectively. District-wide, springflow decreased by 9.7 cfs (6.2 mgd), compared to May 2008 rates.

Compared to historical period-of-record values for May, total springflow measured in Rainbow, Silver and Weeki Wachee Springs, in the northern region, was in the 8^{th}, 5^{th} and 43^{rd} percentiles of respective historical readings. Springflow measured in Crystal, Sulphur, Buckhorn and Lithia Springs in the central region was in the 66^{th}, 37^{th}, 5^{th} and 1^{st} percentiles, respectively, of historical May readings.

[Note: Due to boundary changes in the geographical delineations of the northern, central and southern regions of the District (see index maps in the Appendix), Buckhorn and Lithia Springs are now located in the central region].

GROUND WATER

The ground-water section of this report has been revised and now provides ground-water level information within the District based on geographically delineated areas (regions) within the District, and no longer uses regional delineations based on hydrogeologic characteristics. The purpose for using geographical boundaries (only) has been to eliminate past confusion that resulted when regional ground-water data pertaining to the surficial aquifer and Intermediate/Floridan aquifer were reported based on hydrogeologic boundaries, while the Aquifer Resource Index section reported ground-water data based on geographic boundaries. This change should provide consistency in the review and reporting of all ground-water information.

For this report, the District has been divided into three geographical regions that are defined by county boundaries (see index maps in the Appendix). Each regional area includes all or part of each county that is located within that region and that is also within the District's jurisdictional boundaries. The northern region includes the counties of Citrus, Hernando, Lake, Levy, Marion and Sumter, where the Floridan aquifer is generally unconfined and at or near land surface, allowing rainfall to easily recharge (replenish) the aquifer system. The central region includes the counties of Hillsborough, Pasco, Pinellas and Polk, where the Floridan aquifer can be unconfined, semi-confined or confined (overlain by thick clays). Where the Floridan aquifer is confined, recharge to the aquifer from rainfall is low. The southern region includes the counties of Charlotte, DeSoto, Hardee, Highlands, Manatee and Sarasota, where the Floridan aquifer is confined.

Twelve surficial aquifer (shallow, non-artesian) and 51 intermediate and Floridan aquifer (deep) monitor wells are measured for this report to determine the relative health of ground-water levels District-wide. Only monitor wells with an adequate and reliable period-of-record water level measurements were selected for the network. For each well, the 25^{th} and 75^{th} percentiles ("low normal" and "high normal," respectively) were calculated for each week of the year using the period-of-record data. The 25^{th} and 75^{th} percentiles are used to represent the lower and upper limits of the normal range, as they are considered a reliable and robust measure of the normal range, and are less affected by extremes in the data record. The end-of month water-level readings measured for this report are compared to their corresponding normal ranges. Trend data from 16 intermediate and Floridan aquifer wells are shown in hydrographs to compare current water levels to the low normal and high normal levels.

Data from these wells are further compiled into regional statistics for the three regions of the District. Wells in the northern counties are unconfined and non-artesian, while those in the southern counties are confined and artesian. Wells included in the central counties vary between confined and unconfined conditions due to the transitional nature of geology in this area. The potentiometric levels of representative Floridan aquifer wells are used to produce the potentiometric surface maps presented in this report.

Surficial Aquifer

During May, ten of the twelve surficial aquifer wells recorded water level increases compared to last month. Regionally, average surficial aquifer water levels increased in the northern, central and southern regions of the District by 3.90 feet, 0.50 foot and 0.79 foot, respectively. District-wide, average surficial aquifer water levels increased by 1.14 feet.

In May, average water levels in eight of the twelve surficial aquifer wells were lower than May 2008 levels. Average surficial aquifer water levels were higher in the northern region by 2.00 feet, while they were lower in the central and southern regions by 0.66 and 0.39 foot, respectively. District-wide, average water levels in surficial wells were 0.15 foot lower than May 2008 levels.

At the end of May, water levels were below the normal range in five of the twelve surficial wells. Average surficial aquifer water levels in the northern, central and southern regions were above the bottom of the normal range by 2.35 feet, 0.60 foot and 0.11 foot, respectively. District-wide, the average water level in surficial wells was 0.77 foot above the bottom of the normal range.

Intermediate and Floridan Aquifers

In May, 41 of the 51 intermediate and Floridan aquifer wells monitored for this report recorded water level increases. Regionally, average water levels increased in the northern, central and southern regions of the District by 1.16, 1.05 and 2.36 feet, respectively. District-wide, the mean water level in the intermediate and Floridan aquifer wells increased 1.57 feet.

During May, water levels in 26 of the 51 intermediate and Floridan aquifer wells were higher than those measured in May 2008. Regionally, the mean water level in the northern region was the same as last year's level, while the central region was 0.90 foot lower and the southern region was 0.06 foot higher than May 2008 levels. District-wide, average water levels in intermediate and Floridan aquifer wells were 0.29 foot lower than last year.

For May, 31 of the 51 intermediate and Floridan aquifer wells had levels within the normal range, compared to historical monthly levels. Regionally, the average water level in the northern, central and southern regions was 0.18 foot, 0.73 foot and 1.42 feet, respectively, above the bottom of the normal range. District-wide, the average water level in intermediate and Floridan aquifer wells was 0.77 foot above the bottom of the normal range.

Period-of-record low water levels were recorded at three of the 51 monitor wells in the second week of May 2009. These wells, Weeki Wachee Deep, ROMP 103, and ROMP 97, were all in the Northern Region. Following substantial rains in the region, water levels rose in these wells by the end of the month.

Public Supply Wellfields

Water levels are measured in 21 monitor wells (9 surficial, 12 intermediate and Floridan aquifer wells) located at nine public supply wellfields in the District. Thirteen of the 21 monitor wells have water levels measured monthly, two biweekly, and six weekly. Monthly data are tabulated to compare recent water levels to historical means.

During May, average water levels decreased in eight of the twelve intermediate and Floridan wells and eight of the nine surficial wells. Average water levels measured in the intermediate and Floridan wells decreased 0.03 foot, while levels measured in surficial wells decreased 0.34 foot.

In May, average water levels in all twelve intermediate and Floridan wells and all nine surficial wells were below those measured in May 2008. Water levels measured in the intermediate and Floridan wells averaged 4.02 feet below last year's levels, while surficial water levels averaged 2.68 feet below May 2008 levels.

At the end of May, average water levels in ten of the twelve intermediate and Floridan wells and two of the nine surficial wells were at or above the low normal level, compared to historical monthly levels. Water levels measured in the intermediate and Floridan wells averaged 2.28 feet above the base of the normal range, while levels in the surficial wells averaged 0.59 foot below the base of the normal range.

Period-of-record low water levels were recorded at one of the 12 Intermediate/Floridan monitor wells and one surficial well in the second week of May 2009. These wells are the Morris Bridge 3A Deep and Shallow wells. Following the substantial rains in the region, water levels rose in these wells by the end of the month.

Aquifer Resource Index

The Aquifer Resource Index (ARI) was created to provide information to the media, residents, local governments and other interested parties about current ground-water conditions and how they compare to historical records. The underlying purpose of this index is to provide the public with a gauge of ground-water levels in their area, so they can develop an understanding of the severity and cycles of drought and recovery.

The ARI is derived by comparing current ground-water levels with historical levels for 51 intermediate and Floridan aquifer (deep) monitor wells located throughout the three geographic areas of the District. Monitor wells with an adequate and reliable period-of-record to calculate weekly percentiles were selected for the network.

To determine the ARI value for a geographic area, each well is compared to its respective low-normal value weekly, and the difference is calculated. The weekly differences are used to determine the regional ARI value and the resulting ARI value represents how far water levels in the aquifer have to rise or fall to reach their respective low-normal value. The normal range for the northern region is approximately zero to three feet, zero to five-and-one-half feet for the central region and zero to eight feet for the southern region.

Weekly Aquifer Resource Index Level, In Feet
(Relative to Bottom of the Normal Range or 25th Percentile)

Report Date	Northern Counties	Central Counties	Southern Counties
05/04/2009	-1.96	-1.73	-2.38
05/11/2009	-1.74	-2.24	-3.66

PUBLIC SUPPLY SURFACE WATER RESERVOIRS

CITY OF TAMPA RESERVOIR (Hillsborough River Basin): Constructed in 1924, it is located on the Hillsborough River in Hillsborough County. It is the third largest public supply surface water facility in the District. It is the main water supply for the City of Tampa and has a total storage capacity of 1.7 billion gallons (bg). The total usable volume is 1.4 bg, when the reservoir elevation is 22.5 feet NGVD. It is an in-stream reservoir with a depth that ranges between nine and 22 feet. Given this amount of water, it is estimated that a 15-day supply of water is available from this facility over an extended dry period. During periods of low water due to drought conditions, the facility is permitted to pump water from two alternate sources. The first of these two sources is the Tampa Bypass Canal. Water is pumped over the water control structure at S-161 into the Hillsborough River above the dam. The second source is Sulphur Springs, just downstream from the dam, where water is captured at the spring and pumped back behind the dam. Withdrawals from both sources are in strict accordance with pumpage schedules as outlined in the facility's water use permit. When water levels fall below 12 feet NGVD, water cannot be withdrawn because the reservoir level is below the intake pipes. The permitted average daily withdrawal for this facility is 82 mgd, with a permitted maximum daily withdrawal of 104 mgd. Currently, ground water wells are not used to augment this facility. The minimum producible level is 9.00 feet.

PEACE RIVER RESERVOIR - PEACE RIVER/MANASOTA REGIONAL WATER SUPPLY AUTHORITY (Peace River Basin): The Peace River facility is an off-stream reservoir. Unlike other utilities, the daily river water pumpage is not a reflection of daily water consumed by the public. Built in 1980, the PRMRWSA facility ranks sixth in total volume storage, and supplies water to Charlotte County, City of North Port, and DeSoto County. While all of the available water produced for public supply comes from the Peace River, they have by far the most complicated system for insuring adequate supply throughout the year. The facility also uses an aquifer storage recovery (ASR) system for storing treated water pumped from the river. The current permit restrictions on the PRMRWSA facility state that they may not withdraw water from the Peace River if the river gauging station at Arcadia has declined below pre-established monthly levels. Also, withdrawals may not exceed 10 percent of the preceding day's flow level as calculated at the Peace River Arcadia gauge station. To the greatest extent possible, the PRMRWSA fills its reservoir and ASR facilities to full capacity to insure water is available during times they are not permitted to withdraw from the Peace River. The total size of the reservoir is approximately 85 acres and is 31 feet deep. Total storage capacity is approximately 625 mg. Average and maximum permitted withdrawal amounts from the Peace River are 32.7 and 90.0 mgd, respectively. The Peace River reservoir and ASR system are both permitted for an average withdrawal of 32.7 mgd. The minimum producible level is 8.00 feet.

MANATEE RESERVOIR (Manasota Basin): Completed in 1967 by the damming of the Manatee River, the Manatee Reservoir is the second largest of the six surface-water public supply facilities within the District. Located in Manatee County, this in-stream facility has a storage capacity of 7.5 bg. The service area of the Manatee reservoir is the unincorporated portions of Manatee County, the City of Palmetto and Anna Maria Island, and also the Sarasota SUD#1. This reservoir provides essentially all public supply for

Manatee County, with the exception of the City of Bradenton. The total size of this reservoir is 1800 acres with an average depth of 15 feet. With the reservoir full, the facility has approximately 220 days of available water supply. When the surface-water elevation drops below 21.0 feet, water cannot be withdrawn because levels are below the facility's intakes. The permitted average daily withdrawal for this facility is 34.9 mgd, with a permitted peak monthly quantity of 41.9 mgd. The minimum producible level is 21.00 feet.

EVERS RESERVOIR (Manasota Basin): Constructed in 1935 and expanded in 1985, it is located on the Braden River in Manatee County. This is the fourth largest public supply reservoir in the District. Its main service area is the City of Bradenton and approximately 500 customers outside the city. It has a total storage capacity of 1.5 bg. The total size of the facility is 300 acres with an average depth of 12 feet. Water ceases to flow over the dam when the level falls below 3.84 feet NGVD. During the 1985 drought, while expansion of the facility was taking place, the water level dropped to one foot below sea level and demand was still met. Given a completely full reservoir, with no water going over the spillway, it is estimated the facility could supply water for approximately 260 days, with no input from rainfall. The permitted average daily withdrawal for this facility is 6.95 mgd, with a permitted peak monthly quantity of 8.13 mgd. Currently, ground-water wells are not used to augment this facility.

SHELL CREEK RESERVOIR (Peace River Basin): Shell Creek Reservoir, located in Charlotte County, is the fifth largest surface water system within the District. This system was built in 1964 and services the City of Punta Gorda as well as unincorporated areas surrounding the city limits. The Shell Creek Reservoir is fed by two primary tributaries, Shell Creek from the east and Prairie Creek from the northwest. The total drainage area at Hendrickson Dam is 373 square miles. It has a surface area of 800 acres and depths of 10 to 12 feet. Total storage capacity is 765 mg. Even with this low volume of water, personnel at this facility estimate they have approximately 125 days of available supply with no input from rainfall. Water ceases to flow across the weir when surface elevations drop below 5.0 feet NGVD, and at 3.7 feet NGVD water quality becomes a major concern. When surface elevations drop below 1.75 feet NGVD, the water is below the intakes and withdrawal of water is not possible. The permitted average daily withdrawal by this facility is 5.358 mgd, with a permitted peak monthly quantity of 6.901 mgd. The minimum producible level is 1.70 feet.

C.W. BILL YOUNG REGIONAL RESERVOIR - TAMPA BAY WATER (Alafia River Basin): Constructed in early 2005, it is the largest public supply surface water facility in the District. Located in southern Hillsborough County, it is an off-stream reservoir that stores surface water skimmed from the Tampa Bypass Canal and Alafia and Hillsborough Rivers. It services the Tampa Bay region through the Tampa Bay Water regional public supply water distribution system. The reservoir has an estimated storage capacity of 15.0 bg when the water level elevation is 136.5 feet NGVD. The reservoir is approximately 45 feet deep, two miles long and one mile wide, and encompasses a land area of approximately 1,100 acres. It reportedly has the capacity to provide 25 percent of the Tampa Bay region's public supply needs for six months and can supply the Tampa Bay regional surface water treatment plant at full capacity for 227 days.

Reservoirs

Water-level data for the six reservoirs are obtained weekly from the USGS, Manatee County Utilities Department, Peace River/Manasota Regional Water Supply Authority, or Tampa Bay Water. The weekly data are then reduced to a monthly average. The values reported are provisional and subject to revision.

In May, four of the six reservoirs monitored for this report recorded average water-level decreases compared to last month. The Evers, Lake Manatee, Peace River and Shell Creek reservoirs posted average water level decreases of 0.89, 0.41, 0.67 and 0.05 foot, respectively. The Hillsborough River and Bill Young reservoirs posted water-level increases of 0.29 and 0.65 foot, respectively.

Rainfall characterization ranges

Characterization	Range	Corresponding Rainfall Percent of Normal (approximate)
Very dry	Less than the P10 rainfall	Less than 80 percent of normal
Drier than normal	P10 to P25 rainfall	80 to 90 percent of normal
Normal	P25 to P75 rainfall	90 to 110 percent of normal
Wetter than normal	P75 to P90 rainfall	110 to 120 percent of normal
Very Wet	Greater than the P90 rainfall	Greater than 120 percent of normal

STREAM MONITORING STATIONS

WITHLACOOCHEE RIVER (Northern Region)

Total length:	157 miles
Headwaters:	NW Polk and southern Sumter Counties
Elevation:	135 feet
Tributaries:	Little Withlacoochee, Big Gant Canal, Jumper Creek, Shady Brook, Outlet River of Lake Panasoffkee, Leslie Heifner Canal, Orange State Canal, Tsala Apopka Outfall Canal and Rainbow Springs.
Mouth:	Gulf of Mexico, Citrus County
Average fall:	0.9 feet/mile
Drainage area:	2000 square miles

Holder Station

County:	Marion
Period-of-record:	1928
Location:	38 miles upstream from mouth
Avg daily discharge:	1036.3 cfs
Runoff per year:	10.36 inches
Max of monthly avg discharge:	7096.3 cfs in 04/1960
Min of monthly avg discharge:	111.8 cfs in 07/1992
Drainage area:	1825 square miles

Trilby Station

County:	Hernando
Period-of-record:	1928
Location:	93 miles upstream from mouth
Avg daily discharge:	336.3 cfs
Runoff per year:	6.73 inches
Max of monthly avg discharge:	4254.7 cfs in 09/1933
Min of monthly avg discharge:	6.1 cfs in 07/1992
Drainage area:	570 square miles

ANCLOTE RIVER (Central Region)

Total length:	27.5 miles
Headwaters:	South-central Pasco County, west of Land O Lakes
Elevation:	65 feet
Tributaries:	South Branch and Hollin Creek
Mouth:	Gulf of Mexico, Pasco County
Average fall:	2.4 feet/mile
Drainage area:	113 square miles

Elfers Station

County:	Pasco
Period-of-record:	1946
Location:	16 miles upstream from mouth
Avg daily discharge:	65.1 cfs
Runoff per year:	12.20 inches
Max of monthly avg discharge:	633.8 cfs in 09/1988
Min of monthly avg discharge:	1.4 cfs in 05/1981
Drainage area:	72.5 square miles

HILLSBOROUGH RIVER (Central Region)

Total length:	55 miles
Headwaters:	Southeast Pasco County
Elevation:	77 feet
Tributaries:	Crystal Springs, Blackwater Creek, Flint Creek, Trout Creek, Cypress Creek, Curiosity Creek and Sulphur Springs
Mouth:	Hillsborough Bay
Average fall:	1.4 feet/mile
Drainage area:	690 square miles

Zephyrhills Station

County:	Hillsborough
Period-of-record:	1939
Location:	40 miles upstream from mouth
Avg daily discharge:	244.2 cfs
Runoff per year:	15.05 inches
Max of monthly avg discharge:	2284.5 cfs in 12/1997
Min of monthly avg discharge:	47.1 cfs in 05/1994
Drainage area:	200 square miles

PITHLACHASCOTEE RIVER (Central Region)

Total length:	41 miles
Headwaters:	Crews Lake and Masaryktown area in central Pasco and southern Hernando Counties
Elevation:	120 feet
Mouth:	Gulf of Mexico
Average fall:	2.9 feet/mile
Drainage area:	191 square miles

New Port Richey Station:

County:	Pasco
Period-of-record:	1963
Location:	10.5 miles upstream from mouth
Avg daily discharge:	27.9 cfs
Runoff per year:	2.11 inches
Max of monthly avg discharge:	329.4 cfs in 09/1988
Min of monthly avg discharge:	0.0 cfs
Drainage area:	180 square miles

ALAFIA RIVER (Central Region)

Total length:	24 miles
Headwaters:	Western Polk and eastern Hillsborough Counties
Tributaries:	North and South Prongs, Lithia Springs, and Buckhorn Creek.
Elevation:	30 feet
Mouth:	Tampa Bay
Average fall:	1.5 feet/mile
Drainage area:	420 square miles

Lithia Station:

County:	Hillsborough
Period-of-record:	1932
Location:	16 miles upstream from mouth
Avg daily discharge:	339.7 cfs
Runoff per year:	13.59 inches
Max of monthly avg discharge:	4185.4 cfs in 09/1933
Min of monthly avg discharge:	13.0 cfs in 05/1945
Drainage area:	335 square miles

LITTLE MANATEE RIVER (Central Region)

Total length:	39 miles
Headwaters:	Southeast Hillsborough County
Tributaries:	Carlton Branch, the South Fork, Dug Creek and Cypress Creek.
Elevation:	130 feet
Mouth:	Tampa Bay
Average fall:	3.4 feet/mile
Drainage area:	225 square miles

Wimauma Station:

County:	Hillsborough
Period-of-record:	1939
Location:	15 miles upstream from mouth
Avg daily discharge:	171.4 cfs
Runoff per year:	15.68 inches
Max of monthly avg discharge:	1443.7 cfs in 07/1945
Min of monthly avg discharge:	3.8 cfs in 05/45
Drainage area:	149 square miles

JOSEPHINE CREEK (Southern Region)

Total length:	12 miles
Headwaters:	Lake Josephine in central Highlands County
Elevation:	80 feet
Mouth:	Lake Istokpoga in Highlands County
Average fall:	3.5 feet/mile
Drainage area:	143 square miles

DeSoto City Station:

County:	Highlands
Period-of-record:	1946
Location:	4.9 miles upstream of mouth
Avg daily discharge:	74.2 cfs
Runoff per year:	8.90 inches
Max of monthly avg discharge:	769.9 cfs in 09/1960
Min of monthly avg discharge:	1.1 cfs in 05/56
Drainage area:	109 square miles

MANATEE RIVER (Southern Region)

Total length:	45 miles
Headwaters:	Four corners area Hillsborough, Polk, Hardee and manatee Counties.
Elevation:	130 feet
Mouth:	Tampa Bay
Average fall:	2.9 feet/mile
Drainage area:	330 square miles

Myakka Head Station:

County:	Manatee
Period-of-record:	1966
Location:	36 miles upstream from mouth
Avg daily discharge:	69.6 cfs
Runoff per year:	14.62 inches
Max of monthly avg discharge:	529.7 cfs in 09/1994
Min of monthly avg discharge:	0.5 cfs in 04/75
Drainage area:	65.3 square miles

MYAKKA RIVER (Southern Region)

Total length:	54.1 miles
Headwaters:	Western Hardee and Eastern Manatee Counties
Tributaries:	Howard Creek, Deer Prairie, and Big Slough Canal
Elevation:	105 feet
Mouth:	Charlotte Harbor
Average fall:	1.9 feet/mile
Drainage area:	540 square miles

Sarasota Station:

County:	Sarasota
Period-of-record:	1936
Location:	36 miles upstream from mouth
Avg daily discharge:	250.5 cfs
Runoff per year:	15.03 inches
Max of monthly avg discharge:	2467.2 cfs in 09/1947
Min of monthly avg discharge:	0.0 cfs numerous times
Drainage area:	229 square miles

PEACE RIVER (Central and Southern Region)

Total length:	120 miles
Headwaters:	Green Swamp in northern Polk County through Lake Hancock, Winter Haven chain of lakes, and Lake Hamilton.
Tributaries:	Peace Creek Canal, Saddle Creek, Charlie Creek, Prairie Creek, Horse Creek, Joshua Creek and Shell Creek. Elevation: 110 feet
Mouth:	Charlotte Harbor
Average fall:	1 feet/mile
Drainage area:	2300 square miles

Arcadia Station (Southern Region):

County:	Desoto
Period-of-record:	1931
Location:	36 miles upstream from mouth
Avg daily discharge:	1078.9 cfs
Runoff per year:	10.79 inches
Max of monthly avg discharge:	9876.0 cfs in 09/1933
Min of monthly avg discharge:	51.6 cfs 05/85
Drainage area:	1367 square miles

Bartow Station (Central Region):

County:	Polk
Period-of-record:	1939
Location:	105 miles upstream from mouth
Avg daily discharge:	224.1 cfs
Runoff per year:	6.72 inches
Max of monthly avg discharge:	2261.5 cfs in 09/1960
Min of monthly avg discharge:	6.4 cfs 05/90
Drainage area:	390 square miles

7	Silver Springs near Ocala

SPRINGS MONITORING STATIONS

RAINBOW SPRINGS (Northern Region)

County:	Marion
Basin:	Withlacoochee River
Magnitude:	1st
Discharge measurement location:	5 mi downstream from head of springs
Discharge contributes to:	Rainbow River, Withlacoochee River
Public Access:	Yes
Period-of-record:	1965
Gage:	Non-recording gage
Maximum daily mean:	1061 cfs in 09/1988
Minimum daily mean:	489 cfs in 06/2000

SILVER SPRINGS (Northern Region)

County:	Marion
Basin:	Ocklawaha River
Magnitude:	1st
Discharge measurement location:	4 to 5 mi downstream from head of springs
Discharge contributes to:	Silver Springs River, Ocklawaha River, St. Johns River
Public Access:	Yes
Period-of-record:	1932
Gage:	Water-stage recorder
Maximum daily mean:	1290 cfs in 10/1960
Minimum daily mean:	432 cfs in 07/2000

WEEKI WACHEE SPRINGS (Northern Region)

County:	Hernando
Basin:	Coastal Rivers
Magnitude:	1st
Discharge measurement location:	1 mi downstream from head of springs
Discharge contributes to:	Weeki Wachee River
Public Access:	Yes
Period-of-record:	1993
Gage:	Water-stage
Maximum daily mean:	229 cfs in 03/1998
Minimum daily mean:	101 cfs in 06/1994

CRYSTAL SPRINGS (Central Region)

County:	Pasco
Basin:	Hillsborough River
Magnitude:	2nd
Discharge measurement location:	Difference between discharge measurements of Hillsborough River made upstream from and downstream from Crystal Springs
Discharge contributes to:	Hillsborough River
Public Access:	No
Period-of-record:	1923
Gage:	Non-recording gage
Maximum daily mean:	147 cfs in 07/1941
Minimum daily mean:	22 cfs in 08/1986

SULPHUR SPRINGS (Central Region)

County:	Hillsborough
Basin:	Hillsborough River
Magnitude:	2nd
Discharge measurement location:	300 ft downstream from gage
Discharge contributes to:	Hillsborough River
Public Access:	Yes
Period-of-record:	1956
Gage:	Water-stage recorder
Maximum daily mean:	145 cfs in 03/1960
Minimum daily mean:	0 cfs for various days throughout the period-of-record

BUCKHORN SPRINGS (Central Region)

County:	Hillsborough
Basin:	Alafia River
Magnitude:	2nd
Discharge measurement location:	Difference between discharge measurements of Buckhorn Creek made 25 ft upstream from and 100 ft downstream from Buckhorn Springs
Discharge contributes to:	Buckhorn Creek, Alafia River
Public Access:	No
Period-of-record:	1987
Gage:	Water-stage recorder
Maximum daily mean:	21.9 cfs in 02/1989
Minimum daily mean:	2.7 cfs in 06/1987

LITHIA SPRINGS: (Central Region)

County:	Hillsborough
Basin:	Alafia River
Magnitude:	2nd
Discharge measurement location:	50 feet downstream from main pool
Discharge contributes to:	Alafia River
Public Access:	Yes
Period-of-record:	1934
Gage:	Water-stage recorder
Maximum daily mean:	83.4 cfs in 10/1967
Minimum daily mean:	6.3 cfs in 02/1989
