Hydrologic Conditions

for the month of

May 2013

Prepared by the

Hydrologic Data Section

Data Collection Bureau

Southwest Florida Water Management District

June 25, 2013

http://www.watermatters.org

ACKNOWLEDGMENTS

The Hydrologic Conditions Report is a monthly effort of the Data Collection Bureau's Hydrologic Data Section. Acknowledgment is made to the following staff for their significant contributions, hard work and dedication to the timely production of this report:

Data Collection:	Terry Burrell, Dave Dunnett, Don Everson, George Prine, Steve Saxon, James Ferrell, Jeff Taylor, Everett Eldridge, Greg Johnston and Patrick Casey.
SCADA System:	Mike Katherina.
QA/QC and Reporting:	Margit Crowell, Pam Green, Ken Romie, Steve DeSmith.
Administrative Support:	Karen Diez and Roxanne Frey.

TABLE OF CONTENTS

INTRODUCTION

The Hydrologic Conditions Report is generated monthly by the Hydrologic Data Section, Data Collection Bureau, of the Southwest Florida Water Management District. This report provides an end-of-month analytical summary of regional and temporal variations in the hydrologic conditions across the District's 16-county area for planning and regulatory purposes. In addition, it provides an excellent historical record for long-term local and regional hydrologic analysis.

The Hydrologic Data Section is responsible for the implementation and maintenance of a network of observation and monitoring stations used to track changes in various hydrologic parameters over time. Data collected are used by the regulatory, technical, and analytical sections of the District. Data recently collected and maintained by the section include: station and basin rainfall totals, stream and spring discharge measurements, and surface and ground water levels. Frequency of data collection ranges from hourly to monthly readings. All data collected are processed and analyzed, then uploaded into the Water Management Data Base for general access by the District. The Water Management Data Base is also periodically augmented from the United States Geological Survey's hydrologic data network.

The data presented in this report are monthly rainfall totals, streamflow, springflow, surface and ground water levels, reservoir levels and the Aquifer Resource Index. Associated maps of station locations are at the end of the report in the Appendices. Also reported herein are levels of public supply surface water reservoirs supplemented by various regional utilities. The data contained in this report was collected and analyzed in accordance with generally accepted procedures consistent with applicable scientific and technical standards of practice. The data presented are considered to be the best available at the time of publication and are subject to revision. Any questions about the significance, accuracy, or interpretation of these data should be referred to Granville Kinsman, Manager of the Hydrologic Data Section at (352) 796-7211 or (800) 423-1476, extension 4284.

The data evaluation, analyses and interpretation contained within this report have been prepared or approved by a certified Professional Geologist in accordance with Chapter 492, Florida Statutes.

Steven W. DeSmith 06/20/2013

Americans with Disabilities Act (ADA)

The Southwest Florida Water Management District (District) does not discriminate on the basis of disability. This nondiscrimination policy involves every aspect of the District's functions, including access to and participation in the District's programs and activities. Anyone requiring reasonable accommodation as provided for in the Americans with Disabilities Act should contact the District's Human Resources Director, 2379 Broad Street, Brooksville, Florida 34604-6899; telephone (352) 796-7211, ext. 4702 or 1-800-423-1476 (FL only), ext. 4702; TDD (FL only) 1-800-231-6103; or email to **ADACoordinator@swfwmd.state.fl.us**.

EXECUTIVE SUMMARY

Provisional Hydrologic Conditions as of June 20, 2013

Provisional rainfall totals are provided for the period of June 1, 2013 through June 19, 2013. The northern region has received an average of 6.98 inches, while the historic mean for the northern region for the month of June is 7.43 inches. The central region has received an average of 8.62 inches, while the historic mean for the central region for June is 6.96 inches. The southern region has received an average of 8.27 inches, while the historic mean for the southern region for June is 7.90 inches. District-wide, rainfall averaged 8.05 inches, while the historic mean for the District for June is 7.41 inches.

Provisional lake level data indicate that during the first 18 days of June, regional water levels have increased in the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions of the District. Average lake levels in the northern region increased an average of 0.46 foot and were 3.00 feet below the base of the normal range. Average lake levels in the Tampa Bay region increased 0.93 foot and were 0.60 foot above the base of the normal range. Lake levels in the Polk Uplands region increased 0.34 foot and were 1.54 feet below the base of the normal range. The Lake Wales Ridge region posted an average increase of 0.46 foot and was 3.40 feet below the base of the normal range.

As of June 17, 2013, provisional streamflow data indicates average streamflow increased in all three regions of the District, compared to last month's data. Normal streamflow is flow that falls on or between the 25th and 75th percentiles. The average streamflow for the Withlacoochee River near Holder in the northern region was below-normal at the 12th percentile. The average streamflow for the Hillsborough River near Zephyrhills in the central region was in the normal range at the 67th percentile, while flow in the Peace River at Arcadia in the southern region was normal at the 64th percentile.

Provisional groundwater data, as of June 17, 2013, indicate that levels in the intermediate and Floridan aquifers increased in all three regions of the District, compared to last month’s data. Aquifer levels were within the normal range in all three regions. The normal range is levels that fall on or between the 25th and 75th percentiles. The groundwater level in the northern region was at the 38th percentile, while levels in the central and southern regions were at the 65th and 54th percentile, respectively.

EXECUTIVE SUMMARY

Hydrologic Conditions for May 2013

In May, average rainfall totals were within the normal range in all three regions of the District. The normal range for rainfall is defined by totals that fall on or between the 25th to 75th percentiles of the historical monthly accumulation for each region and where the 50th percentile represents the historical median. The northern region received an average of 2.29 inches of rainfall, equivalent to the 34th percentile of the historical May record. The central region received an average of 3.10 inches of rainfall, equivalent to the 58th percentile, while the southern region received an average of 3.38 inches of rainfall, equivalent to the 53rd percentile of the historical May record. The District-wide rainfall average of 2.97 inches was equivalent to the 47th percentile of the historical May record.

During the eight-month “dry season,” the period from October 1, 2012 through May 31, 2013, rainfall totals for the northern and central regions were “below-normal,” while the southern region was within the normal range. The northern region received an average of 13.26 inches of rainfall, which was 10.06 inches below the historical "dry season" mean rainfall of 23.32 inches. This rainfall average was equivalent to the 6th percentile of historical "dry season" mean rainfall and is classified as "very dry." The central region received an average of 14.85 inches of rainfall, which was 6.82 inches below the historical mean of 21.67 inches. This rainfall average was equivalent to the 17th percentile of the historical "dry season" mean rainfall and is classified as "drier than normal." The southern region received an average rainfall accumulation of 16.10 inches, which was 4.61 inches below the historical mean of 20.71 inches. This rainfall average was equivalent to the 28th percentile of the historical "dry season" mean rainfall and is classified as "normal." District-wide, the “dry season” average rainfall was 14.84 inches, which was 6.95 inches below the historical "dry season" mean rainfall of 21.79 inches. This rainfall average was equivalent to the 15th percentile of the historical "dry season" mean rainfall and is classified as "drier than normal."

During the 12-month period from June 1, 2012 through May 31, 2013, the average rainfall totals in all thre regions of the District were classified as "normal." The northern region received an average of 50.93 inches of rainfall, equivalent to the 36th percentile of the historical annual record. The central region received an average of 51.20 inches of rainfall, equivalent to the 46th percentile, while the southern region received an average of 49.42 inches of rainfall, equivalent to the 39th percentile. The District-wide rainfall average of 50.50 inches was equivalent to the 40th percentile of the historical annual record.

Average lake levels in May were below the annual normal range in the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions of the District. Normal lake levels are defined as levels that fall between the minimum low management level and the minimum flood level. Lake levels in the Northern region decreased by an average of 0.43 foot and were 3.46 feet below the base of the annual normal range. Lake levels in the Tampa Bay region decreased an average of 0.13 foot and were 0.33 foot below the base of the annual normal range. Lake levels in the Polk Uplands region decreased 0.20 foot and were 1.88 feet below the base of the annual normal range. Average lake levels in the Lake Wales Ridge region decreased 0.23 foot and ended the month 3.86 feet below the base of the annual normal range.

Total streamflow in regional index streams, in May, was below-normal in all three regions of the District. Normal streamflow is defined as the flow that falls on or between the 25th and 75th percentiles. Streamflow measured at the Withlacoochee River near Holder station in the northern region was in the 15th percentile. Streamflow in the Hillsborough River near Zephyrhills station in the central region was in the 21st percentile, while streamflow measured at the Peace River at Arcadia station in the southern region was in the 13th percentile during May.

In May, groundwater data showed that levels in the intermediate and Floridan aquifers was below-normal in the northern region of the District, while levels in the central and southern regions were within the normal range. The normal range is defined as the level that falls on or between the 25th and 75th percentiles. The groundwater level in the northern region was in the 23rd percentile, while levels in the central and southern regions were in the 38th and 38th percentiles, respectively.

REGIONAL OVERVIEW OF HYDROLOGIC CONDITIONS

MAY 2013

Northern Region

In May, the northern region received an average of 2.29 inches of rainfall, equivalent to the 34th percentile of the historical May readings, which is considered "normal." Average lake levels decreased in the northern region and ended the month an average of 3.46 feet below the base of the annual normal range. Total streamflow measured in the Withlacoochee River near Holder station decreased and was in the 15th percentile. Regional groundwater levels indicated average surficial aquifer water levels increased and were in the 37th percentile; while levels in the intermediate and Floridan aquifer decreased and were in the 23rd percentile.

Central Region

In May, the central region received an average of 3.10 inches of rainfall, equivalent to the 58th percentile of historical May readings, which is considered "normal." Average lake levels decreased in the Tampa Bay and Polk Uplands regions, ending the month 0.33 foot and 1.88 feet, respectively, below the base of the annual range. Total streamflow measured at the Hillsborough River near Zephyrhills station decreased and was in the 21st percentile. Regional groundwater levels indicated average surficial aquifer water levels decreased and were in the 45th percentile; while levels in the intermediate and Floridan aquifer decreased and were in the 38th percentile.

Southern Region

In May, the southern region received an average of 3.38 inches of rainfall, equivalent to the 53rd percentile of historical May readings, which is considered "normal." Average lake levels decreased in the Lake Wales Ridge region and ended the month 3.86 feet below the base of the annual normal range. Total streamflow measured at the Peace River at Arcadia station decreased and was in the 13th percentile. Regional groundwater levels indicated average surficial aquifer water levels increased and were in the 62nd percentile; while levels in the intermediate and Floridan aquifer decreased and were in the 38th percentile.

RAINFALL

The rainfall data used for all tabulations in this report are provided to the District under contract with an external vendor. These data are created by enhancing contractor-developed NEXRAD radar rainfall imagery with hourly rainfall data collected from the District's network of real-time gauges. This process results in highly accurate cell-based rainfall data representative of conditions over the entire District, including those portions where rainfall data collection would otherwise be limited due to gaps in the gauging network.

As defined by the United States Geological Survey (USGS), a percentile is a value on a scale of one hundred that indicates the percent of a distribution that is equal to or below it. For example, a rainfall total equivalent to the 90th percentile is equal to or greater than 90 percent of the rainfall totals recorded for this month during all years that totals have been recorded.

Percentiles for rainfall were calculated from the historical record by region, and by specific interval. The "wet season" total is the sum of the rainfall from June through September. The "dry season" total is the sum of the rainfall from October through May. The annual total characterization was calculated from a dataset of moving 12-month rainfall sum for the same period (1915 through the most recent completed year). The moving 12-month rainfall sum was used for annual statistics because it provided a much larger dataset, and therefore a better estimate of the true percentiles. The historical 12-month cumulative average is updated monthly.

Characterization ranges were established for each region, and for the whole District, with breaks at the 10th (P10), the 25th (P25), the 75th (P75) and the 90th (P90) percentiles. The rainfall in inches for each percentile break, by rainfall interval and by region and the characterization ranges are summarized in the Appendix.

In May, rainfall totals were within the normal range in all three regions of the District. The normal range for rainfall is defined by totals that fall on or between the 25th to 75th percentiles of the historical monthly average for each region and where the 50th percentile represents the historical mean. The northern region received an average of 2.29 inches of rainfall, equivalent to the 34th percentile of the historical record. The central region received an average of 3.10 inches, equivalent to the 58th percentile; while the southern region received an average of 3.38 inches, equivalent to the 53rd percentile. District-wide, rainfall averaged 2.97 inches, which is equivalent to the 47th percentile of the historical May record.

During the eight-month “dry season,” the period from October 1, 2012 through May 31, 2013, rainfall totals for the northern and central regions were below-normal, while rainfall totals for the southern region was within the normal range. The northern region received an average of 13.26 inches of rainfall, which was 10.06 inches below the historical "dry season" mean rainfall of 23.32 inches. This rainfall average was equivalent to the 6th percentile of historical "dry season" mean rainfall and is classified as "very dry." The central region received an average of 14.85 inches of rainfall, which was 6.82 inches below the historical mean of 21.67 inches. This rainfall average was equivalent to the 17th percentile of the historical "dry season" mean rainfall and is classified as "drier than normal." The southern region received an average rainfall accumulation of 16.10 inches, which

was 4.61 inches below the historical mean of 20.71 inches. This rainfall average was equivalent to the 28th percentile of the historical "dry season" mean rainfall and is classified as "normal." District-wide, the “dry season” average rainfall was 14.84 inches, which was 6.95 inches below the historical "dry season" mean rainfall of 21.79 inches. This rainfall average was equivalent to the 15th percentile of the historical "dry season" mean rainfall and is classified as "drier than normal."

During the 12-month period from June 1, 2012 through May 31, 2013, the average rainfall totals in all three regions were classified as “normal.” The northern region received an average of 50.93 inches of rainfall, equivalent to the 36th percentile of the historical record. The central region received an average of 51.20 inches of rainfall, equivalent to the 46th percentile. The southern region received an average of 49.42 inches of rainfall, equivalent to the 39th percentile. The District-wide rainfall average was 50.50 inches, which is equivalent to the 40th percentile of the historical annual record.

Tampa Monthly Climate Summary for May 2013

According to the National Weather Service, the monthly average temperature (°F) for Tampa was 77.6 degrees, which was 0.8 degrees below normal. The highest temperature recorded during the month was 94 degrees, while the lowest temperature recorded during the month was 61 degrees.

Temperature and Precipitation Outlook

The Climate Prediction Center's (CPC) three-month weather forecast, as of June 20, 2013, indicates above-normal rainfall in all three regions of the District from July through September 2013. The temperature forecast for this same time-period indicates equal chances for above-normal, normal or below-normal temperatures in the northern region of the District, while it indicates above-normal temperatures in the central and southern regions.

For more information log on to the CPC's website at:

http://www.cpc.ncep.noaa.gov/products/OUTLOOKS_index.html

Southwest Florida Water Management District

SURFACE WATER

Lakes

Across the District, 76 lakes have been selected as excellent indicators of current surface water conditions (see index map in Appendix). Water levels of these lakes are read monthly. In general, these lakes are concentrated in four regions, the northern region of Citrus, Hernando, and Sumter Counties, the Tampa Bay region of Hillsborough and Pasco Counties, the Polk Uplands region of northern Polk County, and the Lake Wales Ridge region of Polk and Highlands Counties. In this report, current monthly lake levels are tabulated and compared with previous records as well as District-established management levels. In addition, lake-level data representative of the four regions are presented in hydrographs showing a 15-year history of water levels, as a general indicator of surface-water conditions in that region.

The District's Governing Board (the Board) has established lake management levels for approximately 410 lakes within District boundaries, which are specified in Chapter 40D-8, Florida Administrative Code (F.A.C.). Management levels help protect the water resources of the District and the ecology of the lake or water-body for which it was established. In this report, the following three management levels are used to indicate normal and low lake levels: the Minimum Flood (MF) level, the Minimum Low Management (MLM) level, and the Minimum Extreme Low Management (MELM) level. In general, the MF level corresponds to the normal high level, the MLM to the normal low level, and the MELM to a drought-year low. These levels were derived from various sources, including technical publications, topographic maps, Water Resource Data Reports of the USGS, and other studies. Field investigations are also used to determine past surface levels from water marks, wetland vegetation, dry land vegetation, and to establish the elevation of septic tanks, docks, sea walls, roads and floor slabs.

During a normal year, each of the indicator lakes should reach both the designated normal high (MF) and the normal low (MLM) levels. In addition, it is generally beneficial for lakes to reach the adopted drought year low (MELM) level every four to six years for a short period of time for the biological health of the lake. In this report, hydrographs of representative lakes compare current and recent water levels against **“normal ranges”** defined by the adopted MF and MLM levels.

Of the 76 lakes presented in this report, 17 have water-control structures. These structures are used for water conservation and do not generally influence the water levels with regard to meteorologically wet or dry conditions. During periods of extreme high water, the structures may be operated to minimize flooding.

In May, 68 of the 76 lakes monitored for this report recorded water level decreases. Water levels decreased in the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions of the District by 0.43, 0.13, 0.20 and 0.23 foot, respectively. District-wide, average water levels decreased by 0.22 foot, compared to last month.

In May, average water levels were higher in 66 of the 76 lakes, compared to May 2012. In the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions, average lake levels were higher by 2.48 feet, 0.70 foot, 0.29 foot and 0.66 foot, respectively, compared to last year's levels. District-wide, average lake levels were higher by 0.94 foot.

Water levels in 55 of the 76 lakes were below the annual normal range. Average lake levels in the Northern, Tampa Bay, Polk Uplands, and Lake Wales Ridge regions were 3.46 feet, 0.33 foot, 1.88 feet and 3.86 feet, respectively, below the base of the annual normal range. District-wide, average lake levels were 1.75 feet below the base of the annual normal range. Water levels in 53 of the 76 lakes were above the drought-year levels.

Record Low Level

In May 2013, a period-of-record low lake level was set at Lake Alfred, located in the Polk Uplands region.

Streams

The District processes streamflow data collected by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Streamflow is recorded daily as water elevations at 12 gauging stations in three regions of the District (see index map in the Appendix). The USGS uses rating curves developed from water level elevations to calculate streamflow discharge in units of cubic feet per second (cfs). For this report, the reported streamflow values are the means of the daily discharge volumes for the current month. The period-of-record high and low values correspond to monthly means and not to peak events. Percentile values are calculated from the monthly means for the period of record, for each station. The percentile is the monthly mean statistically ranked on a scale of zero to 100 that indicates the percent of the period-of-record monthly means that are at or above the present monthly mean. The current year's data are provisional, and are subject to revision. Revised data are used for all calculations, as they become available.

Hydrographs are produced for each of the stream stations. Current monthly means for each station are compared to respective 25th and 75th percentiles of the period-of-record monthly means.

In May, eight of the twelve stations monitored for this report had decreased streamflow, compared to last month. Total streamflow decreased in the northern, central and southern regions of the District by 24.1 cfs (15.6 mgd), 16.4 cfs (10.6 mgd) and 19.5 cfs (12.6 mgd), respectively. District-wide, total streamflow decreased an average of 63.1 cfs (40.8 mgd).

Eleven of the twelve monitoring stations recorded higher streamflow in May 2013 than in May 2012. Streamflow was higher in the northern, central and southern regions by 123.8 cfs (80.0 mgd), 101.5 cfs (65.6 mgd) and 115.8 cfs (74.8 mgd), respectively. District-wide, total streamflow was higher, on average, by 356.6 cfs (230.4 mgd), than the May 2012 average.

Compared to historical May discharge values, Withlacoochee River streamflow, measured at the Trilby station and the Holder station averaged in the 24th and 15th percentiles, respectively. Streamflow measured at the stations on the Anclote, Pithlachascotee and Hillsborough Rivers averaged in the 43rd, 43rd and 21st percentiles of respective historical May readings. Streamflow measured at the Alafia River, Little Manatee River and Peace River at Bartow stations averaged in the 43rd, 49th and 7th percentiles of respective historical May readings. Additionally, streamflow measured at the Josephine Creek, Manatee River, Myakka River and Peace River at Arcadia stations averaged in the 59th, 75th, 70th and 13th percentiles of respective historical May readings.

Record Low Level

In May 2013, a period-of-record low daily streamflow for the daily historic period was set at the Pithlachascottee River station, located in the northern region.

Springs

The District processes springflow data collected by Tampa Bay Water through a mutual agreement and by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Springflow is monitored at seven gauging stations in two regions of the District (see index map in the Appendix). Springflow data for Rainbow, Silver and Sulphur Springs are recorded as daily water levels. The USGS uses rating curves developed for these springs from historical water level elevations to calculate springflow discharge in units of cubic feet per second (cfs). Crystal and Weeki Wachee Springs discharge (cfs) is provided as an instantaneous reading calculated by the USGS. Buckhorn and Lithia Springs discharge is obtained from Tampa Bay Water biweekly and weekly, respectively. Period-of-record high and low values correspond to monthly theoretical means and not to peak events. Values are reported as percentiles calculated from an analysis of historical monthly means recorded during a given month. The percentile is the monthly mean ranked on a scale of zero to 100 that indicates the percent of period-of-record values that are above, equal to or below the median (50^{th} percentile) for the current month. The values reported are provisional, and are subject to revision at the end of the water year. Revised USGS springflow data are loaded into the District's WMIS when they become available.

Hydrographs are produced for the seven-springflow stations, and current values are compared to respective 25^{th} and 75^{th} percentiles that are calculated from historical data. The 25^{th} and 75^{th} percentiles are calculated using the SAS™ software system for data analysis using period-of-record monthly theoretical means for each springflow station analyzed.

In May, four of the seven stations reported decreased springflow, compared to the previous month. Total springflow decreased in the northern region of the District by 57.9 cfs (37.4 mgd), while springflow increased in the central region by 4.5 cfs (2.9 mgd). District-wide, springflow decreased by 53.4 cfs (34.5 mgd).

Total springflow recorded in all seven stations was higher in May 2013 than May 2012. Total springflow for the northern and central regions was higher by 233.5 cfs (150.9 mgd) and 28.7 cfs (18.5 mgd), respectively. District-wide, springflow increased by 262.2 cfs (169.4 mgd), compared to May 2012 rates.

Compared to historical period-of-record values for May, total springflow measured in Rainbow, Silver and Weeki Wachee Springs, in the northern region, was in the 4^{th}, 4^{th} and 57^{th} percentiles of respective historical readings. Springflow measured in Crystal, Sulphur, Buckhorn and Lithia Springs in the central region was in the 35^{th}, 8^{th}, 91^{st} and 74^{th} percentiles, respectively, of historical May readings.

GROUND WATER

The ground-water section of this report has been revised and now provides ground-water level information within the District based on geographically delineated areas (regions) within the District, and no longer uses regional delineations based on hydrogeologic characteristics. The purpose for using geographical boundaries (only) has been to eliminate past confusion that resulted when regional ground-water data pertaining to the surficial aquifer and Intermediate/Floridan aquifer were reported based on hydrogeologic boundaries, while the Aquifer Resource Index section reported ground-water data based on geographic boundaries. This change should provide consistency in the review and reporting of all ground-water information.

For this report, the District has been divided into three geographical regions that are defined by county boundaries (see index maps in the Appendix). Each regional area includes all or part of each county that is located within that region and that is also within the District's jurisdictional boundaries. The northern region includes the counties of Citrus, Hernando, Lake, Levy, Marion and Sumter, where the Floridan aquifer is generally unconfined and at or near land surface, allowing rainfall to easily recharge (replenish) the aquifer system. The central region includes the counties of Hillsborough, Pasco, Pinellas and Polk, where the Floridan aquifer can be unconfined, semi-confined or confined (overlain by thick clays). Where the Floridan aquifer is confined, recharge to the aquifer from rainfall is low. The southern region includes the counties of Charlotte, DeSoto, Hardee, Highlands, Manatee and Sarasota, where the Floridan aquifer is confined.

Twelve surficial aquifer (shallow, non-artesian) and 51 intermediate and Floridan aquifer (deep) monitor wells are measured for this report to determine the relative health of ground-water levels District-wide. Only monitor wells with an adequate and reliable period-of-record water level measurements were selected for the network. For each well, the 25^{th} and 75^{th} percentiles ("low normal" and "high normal," respectively) were calculated for each week of the year using the period-of-record data. The 25^{th} and 75^{th} percentiles are used to represent the lower and upper limits of the normal range, as they are considered a reliable and robust measure of the normal range, and are less affected by extremes in the data record. The end-of month water-level readings measured for this report are compared to their corresponding normal ranges. Trend data from 16 intermediate and Floridan aquifer wells are shown in hydrographs to compare current water levels to the low normal and high normal levels.

Data from these wells are further compiled into regional statistics for the three regions of the District. Wells in the northern counties are unconfined and non-artesian, while those in the southern counties are confined and artesian. Wells included in the central counties vary between confined and unconfined conditions due to the transitional nature of geology in this area. The potentiometric levels of representative Floridan aquifer wells are used to produce the potentiometric surface maps presented in this report.

Surficial Aquifer

During May, eight of the twelve surficial aquifer wells recorded water level decreases, compared to last month. Regionally, average surficial aquifer water levels increased in the northern and southern regions of the District by 0.41 and 0.25 foot, respectively, while they decreased in the central region by 0.13 foot. District-wide, average surficial aquifer water levels increased by 0.05 foot.

In May, average water levels in nine of the twelve surficial aquifer wells were higher than May 2012 levels. Average surficial aquifer water levels were higher in the northern and southern regions by 2.44 and 2.05 feet, respectively, while they were lower in the central region by 0.16 foot. District-wide, average water levels in surficial wells were 0.82 foot higher than May 2012 levels.

For May, water levels were above the base of the normal range in eight of the twelve surficial wells. Average surficial aquifer water levels in the northern, central and southern regions were 0.87 foot, 0.71 foot and 1.06 feet, respectively, above the base of the normal range. District-wide, the average water level in surficial wells was 0.83 foot above the base of the normal range.

Intermediate and Floridan Aquifers

In May, 44 of the 51 intermediate and Floridan aquifer wells monitored for this report recorded water level decreases, compared to last month. Regionally, average water levels decreased in the northern, central and southern regions of the District by 0.58 foot, 0.36 foot and 1.21 feet, respectively. District-wide, the average water level in the intermediate and Floridan aquifer decreased by 0.74 foot.

During May, water levels in 45 of the 51 intermediate and Floridan aquifer wells were higher than those measured in May 2012. Regionally, the mean water level in the northern, central and southern regions was higher by 2.22, 2.77 and 4.02 feet, respectively, than May 2012 levels. District-wide, average water levels in intermediate and Floridan aquifer wells were 3.08 feet higher than last year.

For May, 34 of the 51 intermediate and Floridan aquifer wells had levels above the base of the normal range, compared to historical monthly levels. The average water levels in the northern region were 0.46 foot below the base of the normal range, while levels in the central and southern regions were 2.65 and 1.69 feet, respectively, above the base of the normal range. District-wide, the average water level in intermediate and Floridan aquifer wells was 1.44 feet above the base of the normal range.

Public Supply Wellfields

Water levels are measured in 21 monitor wells (9 surficial, 12 intermediate and Floridan aquifer wells) located at nine public supply wellfields in the District. Thirteen of the 21 monitor wells have water levels measured monthly, two biweekly, and six weekly. Monthly data are tabulated to compare recent water levels to historical means.

During May, average water levels decreased in ten of the twelve intermediate and Floridan wells and eight of the nine surficial wells. Average water levels measured in the intermediate and Floridan wells decreased by 0.20 foot, while levels measured in surficial wells decreased by 0.38 foot.

In May, average water levels in eleven of the twelve intermediate and Floridan wells and all nine surficial wells were above last year's levels. Water levels measured in the intermediate and Floridan wells averaged 2.45 feet above last year's levels, while surficial water levels averaged 1.13 feet above May 2012 levels.

For May, average water levels in all twelve intermediate and Floridan wells and all nine surficial wells were above the low normal level, compared to historical monthly levels. Water levels measured in the intermediate and Floridan wells averaged 6.29 feet above the base of the normal range, while levels in the surficial wells averaged 3.62 feet above the base of the normal range.

Aquifer Resource Index

The Aquifer Resource Index (ARI) was created to provide information to the media, residents, local governments and other interested parties about current ground-water conditions and how they compare to historical records. The underlying purpose of this index is to provide the public with a gauge of ground-water levels in their area, so they can develop an understanding of the severity and cycles of drought and recovery.

The ARI is derived by comparing current ground-water levels with historical levels for 51 intermediate and Floridan aquifer (deep) monitor wells located throughout the three geographic areas of the District. Monitor wells with an adequate and reliable period-of-record to calculate weekly percentiles were selected for the network.

To determine the ARI value for a geographic area, each well is compared to its respective low-normal value weekly, and the difference is calculated. The weekly differences are used to determine the regional ARI value and the resulting ARI value represents how far water levels in the aquifer have to rise or fall to reach their respective low-normal value. The normal range for the northern region is approximately zero to three feet, zero to five-and-one-half feet for the central region and zero to eight feet for the southern region.

Weekly Aquifer Resource Index Level, In Feet
(Relative to Bottom of the Normal Range or 25th Percentile)

Report Date	Northern Counties	Central Counties	Southern Counties
05/06/2013	0.44	2.48	5.17
05/13/2013	0.38	2.39	4.65
05/20/2013	-0.07	1.74	2.74
05/29/2013	-0.16	1.65	2.60

Note: A negative value indicates the regional average is below the “Low-Normal” level

*Average Groundwater Level Relative to Low Normal

Compiled By Pam Green

PUBLIC SUPPLY SURFACE WATER RESERVOIRS

CITY OF TAMPA RESERVOIR (Hillsborough River Basin): Constructed in 1924, it is located on the Hillsborough River in Hillsborough County. It is the fourth largest public supply surface water facility in the District. It is the main water supply for the City of Tampa and has a total storage capacity of 1.7 billion gallons (bg). The total usable volume is 1.4 bg, when the reservoir elevation is 22.5 feet NGVD. It is an in-stream reservoir with a depth that ranges between nine and 22 feet. Given this amount of water, it is estimated that a 15-day supply of water is available from this facility over an extended dry period. During periods of low water due to drought conditions, the facility is permitted to pump water from two alternate sources. The first of these two sources is the Tampa Bypass Canal. Water is pumped over the water control structure at S-161 into the Hillsborough River above the dam. The second source is Sulphur Springs, just downstream from the dam, where water is captured at the spring and pumped back behind the dam. Withdrawals from both sources are in strict accordance with pumpage schedules as outlined in the facility's water use permit. When water levels fall below 12 feet NGVD, water cannot be withdrawn because the reservoir level is below the intake pipes. The permitted average daily withdrawal for this facility is 82 mgd, with a permitted maximum daily withdrawal of 104 mgd. Currently, ground water wells are not used to augment this facility. The minimum producible level is 9.00 feet.

PEACE RIVER RESERVOIRS - PEACE RIVER/MANASOTA REGIONAL WATER SUPPLY AUTHORITY (Peace River Basin): The Peace River reservoirs are located in southwestern DeSoto County. They are an off-stream reservoir system consisting of two reservoirs that store surface water captured from the Peace River during wet periods. The first reservoir, Reservoir 1, was built in 1980 and encompasses approximately 85 acres, has a water depth of approximately 31 feet, and has a total storage capacity of approximately 625 million gallons. The second reservoir, Reservoir 2, was built in 2009, covers about 616 acres, has a water depth of approximately 35 feet, and has a total storage capacity of about 6.0 billion gallons. The PRMRWSA facility ranks as the third largest in the District for total volume storage and supplies water to Charlotte, DeSoto, Manatee and Sarasota counties and to the City of North Port. The facility also uses an aquifer storage recovery (ASR) system for storing treated water pumped from the river. The minimum producible level at Reservoir 1 is Elevation 8.0 feet, while Reservoir 2 is Elevation 27.0 feet.

MANATEE RESERVOIR (Manasota Basin): Completed in 1967 by the damming of the Manatee River, the Manatee Reservoir is the second largest of the six surface-water public supply facilities within the District. Located in Manatee County, this in-stream facility has a storage capacity of 7.5 bg. The service area of the Manatee reservoir is the unincorporated portions of Manatee County, the City of Palmetto and Anna Maria Island, and also the Sarasota SUD#1. This reservoir provides essentially all public supply for Manatee County, with the exception of the City of Bradenton. The total size of this reservoir is 1800 acres with an average depth of 15 feet. With the reservoir full, the facility has approximately 220 days of available water supply. When the surface-water elevation drops below 21.0 feet, water cannot be withdrawn because levels are below the facility's intakes. The permitted average daily withdrawal for this facility is 34.9 mgd, with a permitted peak monthly quantity of 41.9 mgd. The minimum producible level is 21.00 feet.

EVERS RESERVOIR (Manasota Basin): Constructed in 1935 and expanded in 1985, it is located on the Braden River in Manatee County. This is the fifth largest public supply reservoir in the District. Its main service area is the City of Bradenton and approximately 500 customers outside the city. It has a total storage capacity of 1.5 bg. The total size of the facility is 300 acres with an average depth of 12 feet. Water ceases to flow over the dam when the level falls below 3.84 feet NGVD. During the 1985 drought, while expansion of the facility was taking place, the water level dropped to one foot below sea level and demand was still met. Given a completely full reservoir, with no water going over the spillway, it is estimated the facility could supply water for approximately 260 days, with no input from rainfall. The permitted average daily withdrawal for this facility is 6.95 mgd, with a permitted peak monthly quantity of 8.13 mgd. Currently, ground-water wells are not used to augment this facility.

SHELL CREEK RESERVOIR (Peace River Basin): Shell Creek Reservoir, located in Charlotte County, is the sixth largest surface water system within the District. This system was built in 1964 and services the City of Punta Gorda as well as unincorporated areas surrounding the city limits. The Shell Creek Reservoir is fed by two primary tributaries, Shell Creek from the east and Prairie Creek from the northwest. The total drainage area at Hendrickson Dam is 373 square miles. It has a surface area of 800 acres and depths of 10 to 12 feet. Total storage capacity is 765 mg. Even with this low volume of water, personnel at this facility estimate they have approximately 125 days of available supply with no input from rainfall. Water ceases to flow across the weir when surface elevations drop below 5.0 feet NGVD, and at 3.7 feet NGVD water quality becomes a major concern. When surface elevations drop below 1.75 feet NGVD, the water is below the intakes and withdrawal of water is not possible. The permitted average daily withdrawal by this facility is 5.358 mgd, with a permitted peak monthly quantity of 6.901 mgd. The minimum producible level is 1.70 feet.

C.W. BILL YOUNG REGIONAL RESERVOIR - TAMPA BAY WATER (Alafia River Basin): Constructed in early 2005, it is the largest public supply surface water facility in the District. Located in southern Hillsborough County, it is an off-stream reservoir that stores surface water skimmed from the Tampa Bypass Canal and Alafia and Hillsborough Rivers. It services the Tampa Bay region through the Tampa Bay Water regional public supply water distribution system. The reservoir has an estimated storage capacity of 15.0 bg when the water level elevation is 136.5 feet NGVD. The reservoir is approximately 45 feet deep, two miles long and one mile wide, and encompasses a land area of approximately 1,100 acres. It reportedly has the capacity to provide 25 percent of the Tampa Bay region's public supply needs for six months and can supply the Tampa Bay regional surface water treatment plant at full capacity for 227 days.

Reservoirs

Water-level data for the seven reservoirs are obtained weekly from the USGS, Manatee County Utilities Department, Peace River/Manasota Regional Water Supply Authority, or Tampa Bay Water. The last weekly water-level value of the month is indicated in this report. The values reported are provisional and subject to revision.

In May, three of the seven reservoirs monitored for this report recorded average water-level increases, three recorded decreases, while one had no change in level, compared to last month. The Evers, Bill Young and Shell Creek reservoirs posted water level increases of 1.02 feet, 0.46 foot and 0.08 foot, respectively. The Hillsborough River and Peace River Nos. 1 and 2 reservoirs posted decreases of 0.31 foot, 0.10 foot and 1.90 feet, respectively. The water-level at the Lake Manatee reservoir remained unchanged from last month.

December total	*District*	0.54	0.89	1.86	2.92	4.34

Rainfall characterization ranges

Characterization	Range	Corresponding Rainfall Percent of Normal (approximate)
Very dry	Less than the P10 rainfall	Less than 80 percent of normal
Drier than normal	P10 to P24 rainfal	80 to 90 percent of normal
Normal	P25 to P75 rainfall	90 to 110 percent of normal
Wetter than normal	P76 to P90 rainfal	110 to 120 percent of normal
Very Wet	Greater than the P90 rainfall	Greater than 120 percent of normal

STREAM MONITORING STATIONS

WITHLACOOCHEE RIVER (Northern Region)

Total length:	157 miles
Headwaters:	NW Polk and southern Sumter Counties
Elevation:	135 feet
Tributaries:	Little Withlacoochee, Big Gant Canal, Jumper Creek, Shady Brook, Outlet River of Lake Panasoffkee, Leslie Heifner Canal, Orange State Canal, Tsala Apopka Outfall Canal and Rainbow Springs.
Mouth:	Gulf of Mexico, Citrus County
Average fall:	0.9 feet/mile
Drainage area:	2000 square miles

Holder Station

County:	Marion
Period-of-record:	1928
Location:	38 miles upstream from mouth
Avg daily discharge:	1036.3 cfs
Runoff per year:	10.36 inches
Max of monthly avg discharge:	7096.3 cfs in 04/1960
Min of monthly avg discharge:	111.8 cfs in 07/1992
Drainage area:	1825 square miles

Trilby Station

County:	Hernando
Period-of-record:	1928
Location:	93 miles upstream from mouth
Avg daily discharge:	336.3 cfs
Runoff per year:	6.73 inches
Max of monthly avg discharge:	4254.7 cfs in 09/1933
Min of monthly avg discharge:	6.1 cfs in 07/1992
Drainage area:	570 square miles

ANCLOTE RIVER (Central Region)

Total length:	27.5 miles
Headwaters:	South-central Pasco County, west of Land O Lakes
Elevation:	65 feet
Tributaries:	South Branch and Hollin Creek
Mouth:	Gulf of Mexico, Pasco County
Average fall:	2.4 feet/mile
Drainage area:	113 square miles

Elfers Station

County:	Pasco
Period-of-record:	1946
Location:	16 miles upstream from mouth
Avg daily discharge:	65.1 cfs
Runoff per year:	12.20 inches
Max of monthly avg discharge:	633.8 cfs in 09/1988
Min of monthly avg discharge:	1.4 cfs in 05/1981
Drainage area:	72.5 square miles

HILLSBOROUGH RIVER (Central Region)

Total length:	55 miles
Headwaters:	Southeast Pasco County
Elevation:	77 feet
Tributaries:	Crystal Springs, Blackwater Creek, Flint Creek, Trout Creek, Cypress Creek, Curiosity Creek and Sulphur Springs
Mouth:	Hillsborough Bay
Average fall:	1.4 feet/mile
Drainage area:	690 square miles

Zephyrhills Station

County:	Hillsborough
Period-of-record:	1939
Location:	40 miles upstream from mouth
Avg daily discharge:	244.2 cfs
Runoff per year:	15.05 inches
Max of monthly avg discharge:	2284.5 cfs in 12/1997
Min of monthly avg discharge:	47.1 cfs in 05/1994
Drainage area:	200 square miles

PITHLACHASCOTEE RIVER (Central Region)

Total length:	41 miles
Headwaters:	Crews Lake and Masaryktown area in central Pasco and southern Hernando Counties
Elevation:	120 feet
Mouth:	Gulf of Mexico
Average fall:	2.9 feet/mile
Drainage area:	191 square miles

New Port Richey Station:

County:	Pasco
Period-of-record:	1963
Location:	10.5 miles upstream from mouth
Avg daily discharge:	27.9 cfs
Runoff per year:	2.11 inches
Max of monthly avg discharge:	329.4 cfs in 09/1988
Min of monthly avg discharge:	0.0 cfs
Drainage area:	180 square miles

ALAFIA RIVER (Central Region)

Total length:	24 miles
Headwaters:	Western Polk and eastern Hillsborough Counties
Tributaries:	North and South Prongs, Lithia Springs, and Buckhorn Creek.
Elevation:	30 feet
Mouth:	Tampa Bay
Average fall:	1.5 feet/mile
Drainage area:	420 square miles

Lithia Station:

County:	Hillsborough
Period-of-record:	1932
Location:	16 miles upstream from mouth
Avg daily discharge:	339.7 cfs
Runoff per year:	13.59 inches
Max of monthly avg discharge:	4185.4 cfs in 09/1933
Min of monthly avg discharge:	13.0 cfs in 05/1945
Drainage area:	335 square miles

LITTLE MANATEE RIVER (Central Region)

Total length:	39 miles
Headwaters:	Southeast Hillsborough County
Tributaries:	Carlton Branch, the South Fork, Dug Creek and Cypress Creek.
Elevation:	130 feet
Mouth:	Tampa Bay
Average fall:	3.4 feet/mile
Drainage area:	225 square miles

Wimauma Station:

County:	Hillsborough
Period-of-record:	1939
Location:	15 miles upstream from mouth
Avg daily discharge:	171.4 cfs
Runoff per year:	15.68 inches
Max of monthly avg discharge:	1443.7 cfs in 07/1945
Min of monthly avg discharge:	3.8 cfs in 05/45
Drainage area:	149 square miles

JOSEPHINE CREEK (Southern Region)

Total length:	12 miles
Headwaters:	Lake Josephine in central Highlands County
Elevation:	80 feet
Mouth:	Lake Istokpoga in Highlands County
Average fall:	3.5 feet/mile
Drainage area:	143 square miles

DeSoto City Station:

County:	Highlands
Period-of-record:	1946
Location:	4.9 miles upstream of mouth
Avg daily discharge:	74.2 cfs
Runoff per year:	8.90 inches
Max of monthly avg discharge:	769.9 cfs in 09/1960
Min of monthly avg discharge:	1.1 cfs in 05/56
Drainage area:	109 square miles

MANATEE RIVER (Southern Region)

Total length:	45 miles
Headwaters:	Four corners area Hillsborough, Polk, Hardee and manatee Counties.
Elevation:	130 feet
Mouth:	Tampa Bay
Average fall:	2.9 feet/mile
Drainage area:	330 square miles

Myakka Head Station:

County:	Manatee
Period-of-record:	1966
Location:	36 miles upstream from mouth
Avg daily discharge:	69.6 cfs
Runoff per year:	14.62 inches
Max of monthly avg discharge:	529.7 cfs in 09/1994
Min of monthly avg discharge:	0.5 cfs in 04/75
Drainage area:	65.3 square miles

MYAKKA RIVER (Southern Region)

Total length:	54.1 miles
Headwaters:	Western Hardee and Eastern Manatee Counties
Tributaries:	Howard Creek, Deer Prairie, and Big Slough Canal
Elevation:	105 feet
Mouth:	Charlotte Harbor
Average fall:	1.9 feet/mile
Drainage area:	540 square miles

Sarasota Station:

County:	Sarasota
Period-of-record:	1936
Location:	36 miles upstream from mouth
Avg daily discharge:	250.5 cfs
Runoff per year:	15.03 inches
Max of monthly avg discharge:	2467.2 cfs in 09/1947
Min of monthly avg discharge:	0.0 cfs numerous times
Drainage area:	229 square miles

PEACE RIVER (Central and Southern Region)

Total length:	120 miles
Headwaters:	Green Swamp in northern Polk County through Lake Hancock, Winter Haven chain of lakes, and Lake Hamilton.
Tributaries:	Peace Creek Canal, Saddle Creek, Charlie Creek, Prairie Creek, Horse Creek, Joshua Creek and Shell Creek. Elevation: 110 feet
Mouth:	Charlotte Harbor
Average fall:	1 feet/mile
Drainage area:	2300 square miles

Arcadia Station (Southern Region):

County:	Desoto
Period-of-record:	1931
Location:	36 miles upstream from mouth
Avg daily discharge:	1078.9 cfs
Runoff per year:	10.79 inches
Max of monthly avg discharge:	9876.0 cfs in 09/1933
Min of monthly avg discharge:	51.6 cfs 05/85
Drainage area:	1367 square miles

Bartow Station (Central Region):

County:	Polk
Period-of-record:	1939
Location:	105 miles upstream from mouth
Avg daily discharge:	224.1 cfs
Runoff per year:	6.72 inches
Max of monthly avg discharge:	2261.5 cfs in 09/1960
Min of monthly avg discharge:	6.4 cfs 05/90
Drainage area:	390 square miles

Map ID	Site Name
1	Lithia Main Spring
2	Buckhorn Main Spring
3	Sulphur Springs at Sulphur Springs
4	Crystal Springs near Zephyrhills
5	Weeki Wachee River near Brooksville
6	Rainbow Springs near Dunnellon
7	Silver Springs near Ocala

SPRINGS MONITORING STATIONS

RAINBOW SPRINGS (Northern Region)

County:	Marion
Basin:	Withlacoochee River
Magnitude:	1st
Discharge measurement location:	5 mi downstream from head of springs
Discharge contributes to:	Rainbow River, Withlacoochee River
Public Access:	Yes
Period-of-record:	1965
Gage:	Non-recording gage
Maximum daily mean:	1061 cfs in 09/1988
Minimum daily mean:	489 cfs in 06/2000

SILVER SPRINGS (Northern Region)

County:	Marion
Basin:	Ocklawaha River
Magnitude:	1st
Discharge measurement location:	4 to 5 mi downstream from head of springs
Discharge contributes to:	Silver Springs River, Ocklawaha River, St. Johns River
Public Access:	Yes
Period-of-record:	1932
Gage:	Water-stage recorder
Maximum daily mean:	1290 cfs in 10/1960
Minimum daily mean:	432 cfs in 07/2000

WEEKI WACHEE SPRINGS (Northern Region)

County:	Hernando
Basin:	Coastal Rivers
Magnitude:	1st
Discharge measurement location:	1 mi downstream from head of springs
Discharge contributes to:	Weeki Wachee River
Public Access:	Yes
Period-of-record:	1993
Gage:	Water-stage
Maximum daily mean:	229 cfs in 03/1998
Minimum daily mean:	101 cfs in 06/1994

CRYSTAL SPRINGS (Central Region)

County:	Pasco
Basin:	Hillsborough River
Magnitude:	2nd
Discharge measurement location:	Difference between discharge measurements of Hillsborough River made upstream from and downstream from Crystal Springs
Discharge contributes to:	Hillsborough River
Public Access:	No
Period-of-record:	1923
Gage:	Non-recording gage
Maximum daily mean:	147 cfs in 07/1941
Minimum daily mean:	22 cfs in 08/1986

SULPHUR SPRINGS (Central Region)

County:	Hillsborough
Basin:	Hillsborough River
Magnitude:	2nd
Discharge measurement location:	300 ft downstream from gage
Discharge contributes to:	Hillsborough River
Public Access:	Yes
Period-of-record:	1956
Gage:	Water-stage recorder
Maximum daily mean:	145 cfs in 03/1960
Minimum daily mean:	0 cfs for various days throughout the period-of-record

BUCKHORN SPRINGS (Central Region)

County:	Hillsborough
Basin:	Alafia River
Magnitude:	2nd
Discharge measurement location:	Difference between discharge measurements of Buckhorn Creek made 25 ft upstream from and 100 ft downstream from Buckhorn Springs
Discharge contributes to:	Buckhorn Creek, Alafia River
Public Access:	No
Period-of-record:	1987
Gage:	Water-stage recorder
Maximum daily mean:	21.9 cfs in 02/1989
Minimum daily mean:	2.7 cfs in 06/1987

LITHIA SPRINGS: (Central Region)

County:	Hillsborough
Basin:	Alafia River
Magnitude:	2nd
Discharge measurement location:	50 feet downstream from main pool
Discharge contributes to:	Alafia River
Public Access:	Yes
Period-of-record:	1934
Gage:	Water-stage recorder
Maximum daily mean:	83.4 cfs in 10/1967
Minimum daily mean:	6.3 cfs in 02/1989
