

# Hydrologic Conditions

for the month of

## October 2021

Prepared by the  
**Hydrologic Data Section**  
**Data Collection Bureau**

November 16, 2021

<http://www.watermatters.org>

## **ACKNOWLEDGMENTS**

The Hydrologic Conditions Report is a monthly effort of the Data Collection Bureau's Hydrologic Data Section. Acknowledgment is made to the following staff for their significant contributions, hard work and dedication to the timely production of this report:

Data Collection:	Terry Burrell, Dave Goldberg-Dunnett, Don Everson, George Prine, James Ferrell, Greg Johnston, Everett Eldridge, Robert Noland, Aaron Cronk, James Thomas and Grayson Conklin.
QA/QC and Reporting:	Margit Crowell, Steve DeSmith, Hunter Alexander and Joey Fogel.
Administrative Support/ Document Preparation :	Karen Diez, Lora Caruso and Shelley Browning.

## INTRODUCTION

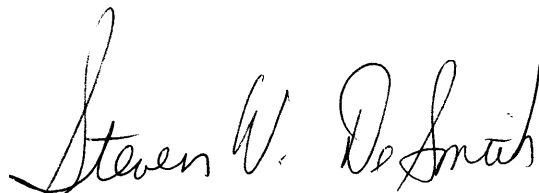

The Hydrologic Conditions Report is generated monthly by the Hydrologic Data Section, Data Collection Bureau, of the Southwest Florida Water Management District. This report provides an end-of-month analytical summary of regional and temporal variations in the hydrologic conditions across the District's 16-county area for planning and regulatory purposes. In addition, it provides an excellent historical record for long-term local and regional hydrologic analysis. **[Notice: There have been substantial changes to the content of this monthly report, as of the July 2020 report.]**

The Hydrologic Data Section is responsible for the implementation and maintenance of a network of observation and monitoring stations used to track changes in various hydrologic parameters over time. Data collected are used by the regulatory, technical, and analytical sections of the District. All data collected are processed and analyzed, uploaded into a centralized data base maintained by the District and then made available to the public through the District's Environmental Data Portal. The District's data collection program is augmented with data collected by the United States Geological Survey (USGS) through a cooperative joint funding agreement. Data derived from both District and USGS sources are used in this report.

The data contained in this report were collected and analyzed in accordance with generally accepted procedures consistent with applicable scientific and technical standards of practice. The data presented are considered to be the best available at the time of publication and are subject to revision.

Any questions about the significance, accuracy, or interpretation of these data should be referred to Tamera McBride, Manager of the Hydrologic Data Section at (352) 796-7211 or (800) 423-1476, extension 4284.

The data evaluation, analyses and interpretation contained within this report have been prepared or approved by a certified Professional Geologist in accordance with Chapter 492, Florida Statutes.

Registration #PG-1704

### Americans with Disabilities Act (ADA)

The Southwest Florida Water Management District (District) does not discriminate on the basis of disability. This nondiscrimination policy involves every aspect of the District's functions, including access to and participation in the District's programs, services and activities. Anyone requiring reasonable accommodation, or who would like information as to the existence and location of accessible services, activities, and facilities, as provided for in the Americans with Disabilities Act, should contact the Human Resources Office Chief, at 2379 Broad St., Brooksville, FL 34604-6899; telephone (352) 796-7211 or 1-800-423-1476 (FL only), ext. 4747; or email [ADACoordinator@WaterMatters.org](mailto:ADACoordinator@WaterMatters.org). If you are hearing or speech impaired, please contact the agency using the Florida Relay Service, 1-800-955-8771 (TDD) or 1-800-955-8770 (Voice). If requested, appropriate auxiliary aids and services will be provided at any public meeting, forum, or event of the District. In the event of a complaint, please follow the grievance procedure located at [WaterMatters.org/ADA](http://WaterMatters.org/ADA).

## EXECUTIVE SUMMARY

### Hydrologic Conditions for October 2021

In October, average rainfall totals were within the normal range in all three regions of the District. The normal range for rainfall is defined by totals that fall on or between the 25<sup>th</sup> to 75<sup>th</sup> percentiles of the historical monthly accumulation for each region and where the 50<sup>th</sup> percentile represents the historical mean. The northern counties received an average of 3.17 inches of rainfall, equivalent to the 64<sup>th</sup> percentile of the historical October record. The central counties received an average of 2.45 inches of rainfall, equivalent to the 50<sup>th</sup> percentile, while the southern counties received an average of 2.11 inches of rainfall, equivalent to the 40<sup>th</sup> percentile of the historical October record. The District-wide rainfall average of 2.53 inches was equivalent to the 49<sup>th</sup> percentile of the historical October record.

During the 12-month period from November 1, 2020 through October 31, 2021, the average rainfall totals in the northern counties were classified as “wetter than normal,” while the central and southern counties were classified as “normal.” The northern region received an average of 59.40 inches of rainfall, equivalent to the 78<sup>th</sup> percentile of the historical annual record. The central region received an average of 49.67 inches of rainfall, equivalent to the 40<sup>th</sup> percentile, while the southern region received an average of 48.34 inches of rainfall, equivalent to the 35<sup>th</sup> percentile. The District-wide rainfall average of 51.90 inches was equivalent to the 46<sup>th</sup> percentile of the historical annual record.

Average lake levels in October were within the normal range in all four lake regions of the District. Normal lake levels are defined as levels that fall between the minimum low management level and the minimum flood level. Lake levels in the Northern region decreased by an average of 0.35 foot and were 0.52 foot above the annual normal range. Lake levels in the Tampa Bay region decreased an average of 0.33 foot and were 1.21 feet above the base of the annual normal range. Average lake levels in the Polk Uplands region decreased by an average of 0.34 foot and were 1.52 feet above the base of the annual normal range. Average lake levels in the Lake Wales Ridge region decreased by 0.23 foot and ended the month 0.74 foot above the base of the annual normal range.

Total streamflow in October, based on three regional index rivers, was within the normal range in all three regions of the District. Normal streamflow is defined as the flow that falls on or between the 25<sup>th</sup> and 75<sup>th</sup> percentiles. Streamflow measured at the Withlacoochee River near Holder station in the northern counties decreased and was at the 61<sup>st</sup> percentile. Streamflow in the Hillsborough River near Zephyrhills station in the central counties decreased and was at the 48<sup>th</sup> percentile, while total streamflow measured at the Peace River at Arcadia station in the southern counties decreased and was at the 41<sup>st</sup> percentile during October.

In October, groundwater data showed that the average regional level in the Upper Floridan aquifer was “above-normal” in the northern counties of the District, while average regional levels were within the normal range in the central and southern counties. The normal range is defined as levels that fall on or between the 25<sup>th</sup> and 75<sup>th</sup> percentiles. The average regional groundwater level in the northern, central and southern counties were at the 87<sup>th</sup>, 60<sup>th</sup> and 52<sup>nd</sup> percentiles, respectively.

## REGIONAL OVERVIEW OF HYDROLOGIC CONDITIONS

### OCTOBER 2021

For this report, the District has been divided into three geographical regions that are defined by county boundaries, unless otherwise indicated. Each regional area includes all or part of each county that is located within that region and that is also within the District's jurisdictional boundaries. The northern region includes the counties of Citrus, Hernando, Lake, Levy, Marion and Sumter; the central region includes the counties of Hillsborough, Pasco, Pinellas and Polk; while the southern region includes the counties of Charlotte, DeSoto, Hardee, Highlands, Manatee and Sarasota.

#### **Northern Region**

In October, the northern region received an average of 3.17 inches of rainfall, equivalent to the 64<sup>th</sup> percentile of the historical October readings, which is considered "normal." Average lake levels decreased in the northern region and ended the month an average of 0.52 foot above the base of the annual normal range. Total streamflow measured in the Withlacoochee River near Holder station decreased and was in the 61<sup>st</sup> percentile. Regional groundwater levels indicated Upper Floridan aquifer water levels decreased and were in the 87<sup>th</sup> percentile.

#### **Central Region**

In October, the central region received an average of 2.45 inches of rainfall, equivalent to the 50<sup>th</sup> percentile of historical October readings, which is considered "normal." Average lake levels decreased in the Tampa Bay and Polk Uplands regions, ending the month 1.21 and 1.52 feet, respectively, above the base of the annual normal range. Total streamflow measured at the Hillsborough River near Zephyrhills station decreased and was in the 48<sup>th</sup> percentile. Regional groundwater levels indicated average Upper Floridan aquifer water levels decreased and were in the 60<sup>th</sup> percentile.

#### **Southern Region**

In October, the southern region received an average of 2.11 inches of rainfall, equivalent to the 40<sup>th</sup> percentile of historical October readings, which is considered "normal." Average lake levels decreased in the Lake Wales Ridge region and ended the month 0.74 foot above the base of the annual normal range. Total streamflow measured at the Peace River at Arcadia station decreased and was in the 41<sup>st</sup> percentile. Regional groundwater levels indicated average Upper Floridan aquifer water levels decreased and were in the 52<sup>nd</sup> percentile.

## RAINFALL

The rainfall data used for all tabulations in this report are provided to the District under contract with an external vendor. These data are created by enhancing contractor-developed NEXRAD radar rainfall imagery with 15-minute rainfall data collected from the District's network of real-time gauges. This process results in rainfall estimates for every 1.5 square-miles over the entire District, filling in those portions where rainfall data collection would otherwise be limited due to gaps in the gauging network.

Rainfall data are evaluated by using the current values to calculate percentiles in order to determine how normal or abnormal they are. As defined by the United States Geological Survey (USGS), a percentile is a value on a scale of one hundred that indicates the percent of a distribution that is equal to or below it. For example, a rainfall total that is calculated to be equivalent to the 90<sup>th</sup> percentile indicates that it is higher than 90 percent of the rainfall totals ever recorded for this month during all years that rainfall has been measured.

Percentiles for rainfall were calculated from the historical record by region, and by specific interval. The "wet season" total is the sum of the rainfall from June through September. The "dry season" total is the sum of the rainfall from October through May. The annual total characterization was calculated from a dataset of moving 12-month rainfall sum for the same period (1915 through the most recent completed year). The moving 12-month rainfall sum was used for annual statistics because it provided a much larger dataset, and therefore a better estimate of the true percentiles. The historical 12-month cumulative average is updated monthly.

Characterization ranges were established for each region, and for the whole District, with breaks at the 10<sup>th</sup> (P10), the 25<sup>th</sup> (P25), the 75<sup>th</sup> (P75) and the 90<sup>th</sup> (P90) percentiles. The normal range for rainfall is defined by totals that fall on or between the 25<sup>th</sup> to 75<sup>th</sup> percentiles of the historical monthly average for each region and where the 50<sup>th</sup> percentile represents the historical median. The zero percentile indicates a new period-of-record low and the 100<sup>th</sup> percentile is a new record high. The rainfall in inches for each percentile break, by rainfall interval and by region and the characterization ranges are summarized in the Appendix.

In October, rainfall totals were within the normal range all three regions of the District. The normal range for rainfall is defined by totals that fall on or between the 25<sup>th</sup> to 75<sup>th</sup> percentiles of the historical monthly average for each region and where the 50<sup>th</sup> percentile represents the historical median. The northern counties received an average of 3.17 inches of rainfall, equivalent to the 64<sup>th</sup> percentile of the historical October record. The central counties received an average of 2.45 inches, equivalent to the 50<sup>th</sup> percentile of the historical October record, while the southern counties received an average of 2.11 inches, equivalent to the 40<sup>th</sup> percentile. District-wide, rainfall averaged 2.53 inches, which is equivalent to the 49<sup>th</sup> percentile.

During the 12-month period from November 1, 2020 through October 31, 2021, the average rainfall totals in the northern counties were classified as "wetter than normal," while the central and southern counties were classified as "normal." The northern counties received an average of 59.40 inches of rainfall, equivalent to the 78<sup>th</sup> percentile of the historical record. The central counties received an average of 49.67 inches of rainfall, equivalent to the 40<sup>th</sup> percentile. The southern counties received an average of

48.34 inches of rainfall, equivalent to the 35<sup>th</sup> percentile. The District-wide rainfall average was 51.90 inches, which is equivalent to the 46<sup>th</sup> percentile of the historical annual record.

### **Tampa Monthly Climate Summary for October 2021**

According to the National Weather Service (NWS), the monthly average temperature (°F) for Tampa was 80.4 degrees, which was 3.0 degrees above normal. The highest temperature recorded during the month was 93.0 degrees, while the lowest temperature recorded during the month was 62.0 degrees. Based on NWS data, the October 2021 monthly average temperature of 80.4 degrees ties with 1919 as the 3<sup>rd</sup> warmest October since records began in 1890. The warmest October had an average temperature of 81.5 degrees, which occurred in 2020.

### **Temperature and Precipitation Outlook**

The Climate Prediction Center's (CPC) three-month weather forecast, as of October 21, 2021, indicates below-normal rainfall throughout the District during the composite 3-month period from November 2021 through January 2022. The temperature forecast for this same time-period indicates above-normal temperatures throughout the District.

[Note: Due to the early publication date of November 16, 2021 for this report, the CPC's November 18, 2021 forecast was unavailable.]

## SURFACE WATER

### Lakes

Across the District, 75 lakes have been selected as excellent indicators of current surface water conditions (see index map in Appendix). Water levels of these lakes are read monthly. In general, these lakes are concentrated in four regions, the northern region of Citrus, Hernando, and Sumter Counties, the Tampa Bay region of Hillsborough and Pasco Counties, the Polk Uplands region of northern Polk County, and the Lake Wales Ridge region of Polk and Highlands Counties. In this report, current monthly lake levels are tabulated and compared with previous records as well as District-established management levels. In addition, lake-level data representative of the four regions are presented in hydrographs showing a 15-year history of water levels, as a general indicator of surface-water conditions in that region.

The District's Governing Board (the Board) has established lake management levels for approximately 410 lakes within District boundaries, which are specified in Chapter 40D-8, Florida Administrative Code (F.A.C.). Management levels help protect the water resources of the District and the ecology of the lake or water-body for which it was established. In this report, the following three management levels are used to indicate normal and low lake levels: the Minimum Flood (MF) level, the Minimum Low Management (MLM) level, and the Minimum Extreme Low Management (MELM) level. In general, the MF level corresponds to the normal high level, the MLM to the normal low level, and the MELM to a drought-year low. These levels were derived from various sources, including technical publications, topographic maps, Water Resource Data Reports of the USGS, and other studies. Field investigations are also used to determine past surface levels from water marks, wetland vegetation, dry land vegetation, and to establish the elevation of septic tanks, docks, sea walls, roads and floor slabs.

During a normal year, each of the indicator lakes should reach both the designated normal high (MF) and the normal low (MLM) levels. In addition, it is generally beneficial for lakes to reach the adopted drought year low (MELM) level every four to six years for a short period of time for the biological health of the lake. In this report, hydrographs of representative lakes compare current and recent water levels against “**normal ranges**” defined by the adopted MF and MLM levels.

Of the 75 lakes presented in this report, 17 have water-control structures. These structures are used for water conservation and do not generally influence the water levels with regard to meteorologically wet or dry conditions. During periods of extreme high water, the structures may be operated to minimize flooding.

Compared to September data, 69 of the 75 lakes monitored for this report recorded water level decreases, while 6 recorded increases. Average water levels decreased in the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions by 0.35, 0.33, 0.34 and 0.23 foot, respectively. District-wide, average water levels decreased by 0.32 foot, compared to last month.

Compared to October 2020 data, 47 of the 75 lakes monitored for this report recorded water level decreases, while 27 recorded increases and one reported no change. In the Northern and Tampa Bay regions, average levels were 0.15 and 0.09 foot, respectively, higher than last year's levels. In the Polk Uplands and Lake Wales Ridge regions, average levels were lower by 1.03 feet and 0.53 foot, respectively. District-wide, average lake levels were lower by 0.26 foot, compared to last year's levels.

In October 2021, water levels in 67 of the 75 lakes were within the annual normal range, while eight were below. Lake levels in the Northern, Tampa Bay, Polk Uplands and Lake Wales Ridge regions averaged 0.52 foot, 1.21 feet, 1.52 feet and 0.74 foot, respectively, above the base of the annual normal range. District-wide, average lake levels were 1.10 feet above the base of the annual normal range. Water levels in 71 of the 75 lakes were above the drought-year levels.

## SUMMARY OF LAKE ELEVATIONS OF REGIONAL LAKES (feet)

NORTHERN LAKES															
Lake Name	County	Beginning of Record	SEP 2021	OCT 2021	OCT 2020	Change from SEP 2021	Change from OCT 2020	Diff from MELM	(MELM) Drought Year Low	(MLM) Normal Year Low	(MF) Normal Year High	Period of Record Low	Record Low Date	Period of Record High	Record High Date

## **Streams**

The District processes streamflow data collected by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Streamflow is recorded daily as water elevations at 12 gauging stations in three regions of the District (see index map in the Appendix). The USGS uses rating curves developed from water level elevations to calculate streamflow discharge in units of cubic feet per second (cfs). For this report, the reported streamflow values are the means of the daily discharge volumes for the current month. The period-of-record high and low values correspond to monthly means and not to peak events. Percentile values are calculated from the monthly means for the period of record, for each station. The percentile is the monthly mean statistically ranked on a scale of zero to 100 that indicates the percent of the period-of-record monthly means that are at or above the present monthly median. The zero percentile indicates a new period-of-record low and the 100<sup>th</sup> percentile is a new record high level. The current year's data are provisional and are subject to revision. Revised data are used for all calculations, as they become available.

Hydrographs are produced for each of the stream stations. Current monthly means for each station are compared to respective 25<sup>th</sup> and 75<sup>th</sup> percentiles of the period-of-record monthly means, reflecting the normal range of readings for the month.

Compared to September data, all 12 stations monitored for this report recorded decreased streamflow

Compared to October 2020 data, 10 of the 12 stations recorded streamflow decreases, while two recorded increases.

Compared to historical October discharge values, Withlacoochee River streamflow, measured at the Trilby station and the Holder station averaged in the 41<sup>st</sup> and 61<sup>st</sup> percentiles, respectively. Streamflow measured at the stations on the Anclote, Pithlachascotee and Hillsborough Rivers averaged in the 67<sup>th</sup>, 66<sup>th</sup> and 48<sup>th</sup> percentiles of respective historical October readings. Streamflow measured at the Alafia River, Little Manatee River and Peace River at Bartow stations averaged in the 79<sup>th</sup>, 45<sup>th</sup> and 19<sup>th</sup> percentiles of respective historical October readings. Additionally, streamflow measured at the Josephine Creek, Manatee River, Myakka River and Peace River at Arcadia stations averaged in the 67<sup>th</sup>, 66<sup>th</sup>, 55<sup>th</sup> and 41<sup>st</sup> percentiles of respective historical October readings.

## **Springs**

The District processes springflow data collected by Tampa Bay Water through a mutual agreement and by the U.S. Geological Survey (USGS) under a cooperatively funded program between the District and the USGS. Springflow is monitored at six gauging stations in two regions of the District (see index map in the Appendix). Springflow data for Rainbow, Silver and Sulphur Springs are recorded as daily water levels. The USGS uses rating curves developed for these springs from historical water level elevations to calculate springflow discharge in units of cubic feet per second (cfs). Weeki Wachee Springs discharge (cfs) is provided as an instantaneous reading calculated by the USGS. Buckhorn and Lithia Springs discharge is obtained from Tampa Bay Water biweekly and weekly, respectively. Period-of-record high and low values correspond to monthly theoretical means and not to peak events. Values are reported as percentiles calculated from an analysis of historical monthly means recorded during a given month. The percentile is the monthly mean ranked on a scale of zero to 100, where the normal range is defined by flows between the 25<sup>th</sup> to 75<sup>th</sup> percentiles. The zero percentile indicates a new period-of-record low and the 100<sup>th</sup> percentile is a new record high. The values reported are provisional and are subject to revision at the end of the water year.

Compared to September data, four of the six stations monitored for this report recorded decreased springflow, while one station reported increased springflow. Monthly discharge data for Lithia Springs for September was not available for this report.

Compared to October 2020 data, four of the six stations recorded increased springflow, while two station reported decreased springflow.

Compared to historical period-of-record values for October, total springflow measured in Rainbow, Silver and Weeki Wachee Springs, in the northern region, was in the 57<sup>th</sup>, 60<sup>th</sup> and 85<sup>th</sup> percentiles, respectively, of historical October readings. Springflow measured in Sulphur, Buckhorn and Lithia Springs in the central region, was in the 31<sup>st</sup>, 9<sup>th</sup> and 90<sup>th</sup> percentiles, respectively, of historical October readings.

## GROUNDWATER

The groundwater section of this report provides groundwater level information for the Upper Floridan Aquifer (UFA) located within the District. As earlier indicated, the District is divided into three geographical regions defined by county boundaries (see index maps in the Appendix). In the northern counties, the UFA is generally at or near land surface, allowing rainfall to easily recharge (replenish) the aquifer system. In the central counties, the UFA can be unconfined or confined (overlain by thick clays). Where the UFA is confined, recharge to the aquifer from rainfall is low. In the southern counties, the UFA is confined.

Eighty-two UFA monitor wells are measured for this report to determine the relative health of groundwater levels District-wide. Only monitor wells with an adequate and reliable period-of-record of water level measurements were selected for the network. For each well, the 25<sup>th</sup> and 75<sup>th</sup> percentiles ("low normal" and "high normal," respectively) were calculated for each week of the year using the period-of-record data. The 25<sup>th</sup> and 75<sup>th</sup> percentiles are used to represent the lower and upper limits of the normal range, as they are considered a reliable and robust measure of the normal range and are less affected by extremes in the data record. The end-of month water-level readings measured for this report are compared to their corresponding normal ranges. Trend data from 16 wells are shown in hydrographs to compare current water levels to the low normal and high normal levels. Data from all 81 wells is further compiled into regional statistics for the three regions of the District. There are 20 wells located in the northern counties, 32 wells located in the central counties and 29 wells located in the southern counties, that are currently used for determining the regional percentiles. The potentiometric levels of representative Floridan aquifer wells are used to produce the potentiometric surface maps presented in this report.

### Upper Floridan Aquifer

Since September, 78 of the 81 wells monitored for this report recorded water level decreases, while three recorded increases. Regionally, average water levels decreased in the northern, central and southern counties by 0.49 foot, 2.96 feet and 4.01 feet, respectively. District-wide, the average water level in the UFA decreased by 2.73 feet.

Compared to October 2020 data, 49 of the 81 wells monitored for this report recorded water level decreases, while 32 recorded increases. Regionally, the mean water level in the northern counties was higher by 2.11 feet, while it was lower in the central and southern counties by 0.86 foot and 2.26 feet, respectively. District-wide, average water levels in UFA wells were 0.63 foot lower than October 2020 levels.

In October, groundwater data showed that average regional levels in the UFA ended the month at above-normal levels in the northern counties, while average levels were within the normal range in the central and southern counties. The groundwater level in the northern, central and southern counties ended the month at the 87<sup>th</sup>, 60<sup>th</sup> and 52<sup>nd</sup> percentiles, respectively.

### Record High Water Level

During October 2021, a "record high" monthly water level for the historic October readings was set in the following wells:

- CE 14 Dunnellon Deep, located in the Northern Counties;

- Chassahowitzka 1 Deep, located in the Northern Counties;
- North Lecanto Deep, located in the Northern Counties;
- ROMP 93 Swann/Avpk, located in the Central Counties; and
- ROMP TR 10-2 Tampa, located in the Central Counties.

## SUMMARY OF UPPER FLORIDAN AQUIFER LEVELS IN REPRESENTATIVE WELLS, OCTOBER 2021

## **Regional Aquifer Resource Index**

Aquifers are underground layers of rock and sand that hold water. In southwest Florida, more than 80 percent of the water supply comes from aquifers. The Regional Aquifer Resource Index (ARI) was created to provide information to the media, residents, local governments and other interested parties about current groundwater conditions and how they compare to historical records. The underlying purpose of this index is to provide the public with a gauge of groundwater conditions in their area, so they can develop an understanding of the severity and cycles of drought and recovery.

This ARI report reflects percentile values to compare current aquifer levels to historical levels during the same time of year on a scale of 0-100. For example, if the regional groundwater level is at the 50th percentile, it means that half of the historical groundwater levels for this time of year were higher and half were lower than the current level.

To determine the ARI percentile value for each geographic region (indicated below), the percentile values of the monitor wells located within that region are averaged. Monitor wells with an adequate and reliable period-of-record to calculate weekly percentiles were selected for the network. A total of 81 wells District-wide are used for the ARI Network (see index map in Appendix).

### **Weekly Aquifer Resource Index Level (Percentile)**

<b>Report Date</b>	<b>Northern Counties</b>	<b>Central Counties</b>	<b>Southern Counties</b>
10/03/2021	82	59	61
10/10/2021	82	54	49
10/17/2021	81	50	44
10/24/2021	83	46	38
10/31/2021	87	60	52

Note: Any regional percentile value that falls on or between the 25<sup>th</sup> and 75<sup>th</sup> percentile is considered “normal.” Less than the 25<sup>th</sup> would be considered “below-normal,” while above the 75<sup>th</sup> would be considered “above-normal.”

# REGIONAL AQUIFER RESOURCE INDEX

## October 2021

Groundwater Levels: Northern Counties  
January 2004 through October 2021

Groundwater Levels: Central Counties  
January 2004 through October 2021

Groundwater Levels: Southern Counties  
January 2004 through October 2021

## **Reservoirs**

Water-level data for the seven reservoirs are obtained weekly from the USGS, Manatee County Utilities Department, Peace River/Manasota Regional Water Supply Authority, or Tampa Bay Water. The last weekly water-level value of the month is indicated in this report. The values reported are provisional and subject to revision.

In October, four of the seven reservoirs monitored for this report recorded water-level increases, while three recorded decreases, compared to last month. The Hillsborough River, Lake Manatee, Peace River No. 2 and Shell Creek reservoirs posted water level increases of 0.34, 1.00, 0.50 and 0.02 foot, respectively. The Evers, Bill Young and Peace River No. 1 reservoirs posted water level decreases of 0.21, 0.25 and 0.10 foot, respectively, compared to last month.

**SUMMARY OF WATER LEVELS IN WATER SUPPLY RESERVOIRS (GAGE LEVEL, IN FEET)**

## **STREAM MONITORING STATIONS**

### **WITHLACOOCHEE RIVER (Northern Region)**

Total length: 157 miles  
Headwaters: NW Polk and southern Sumter Counties  
Elevation: 135 feet  
Tributaries: Little Withlacoochee, Big Gant Canal, Jumper Creek, Shady Brook, Outlet River of Lake Panasoffkee, Leslie Heifner Canal, Orange State Canal, Tsala Apopka Outfall Canal and Rainbow Springs.  
Mouth: Gulf of Mexico, Citrus County  
Drainage area: 2000 square miles

#### **Holder Station**

County: Marion  
Period-of-record: 1928  
Location: 38 miles upstream from mouth  
Drainage area: 1825 square miles

#### **Trilby Station**

County: Hernando  
Period-of-record: 1928  
Location: 93 miles upstream from mouth  
Drainage area: 570 square miles

### **ANCLOTE RIVER (Central Region)**

Total length: 27.5 miles  
Headwaters: South-central Pasco County, west of Land O Lakes  
Elevation: 65 feet  
Tributaries: South Branch and Hollin Creek  
Mouth: Gulf of Mexico, Pasco County  
Drainage area: 113 square miles

#### **Elfers Station**

County: Pasco  
Period-of-record: 1946  
Location: 16 miles upstream from mouth  
Drainage area: 72.5 square miles

### **HILLSBOROUGH RIVER (Central Region)**

Total length: 55 miles  
Headwaters: Southeast Pasco County  
Elevation: 77 feet  
Tributaries: Crystal Springs, Blackwater Creek, Flint Creek, Trout Creek, Cypress Creek, Curiosity Creek and Sulphur Springs  
Mouth: Hillsborough Bay  
Drainage area: 690 square miles

#### **Zephyrhills Station**

County: Hillsborough  
Period-of-record: 1939  
Location: 40 miles upstream from mouth  
Drainage area: 200 square miles

**PITHLACHASCOTEE RIVER (Central Region)**

Total length: 41 miles  
Headwaters: Crews Lake and Masaryktown area in central Pasco and southern Hernando Counties  
Elevation: 120 feet  
Mouth: Gulf of Mexico  
Drainage area: 191 square miles

**New Port Richey Station:**

County: Pasco  
Period-of-record: 1963  
Location: 10.5 miles upstream from mouth  
Drainage area: 180 square miles

**ALAFIA RIVER (Central Region)**

Total length: 24 miles  
Headwaters: Western Polk and eastern Hillsborough Counties  
Tributaries: North and South Prongs, Lithia Springs, and Buckhorn Creek.  
Elevation: 30 feet  
Mouth: Tampa Bay  
Drainage area: 420 square miles

**Lithia Station:**

County: Hillsborough  
Period-of-record: 1932  
Location: 16 miles upstream from mouth  
Drainage area: 335 square miles

**LITTLE MANATEE RIVER (Central Region)**

Total length: 39 miles  
Headwaters: Southeast Hillsborough County  
Tributaries: Carlton Branch, the South Fork, Dug Creek and Cypress Creek.  
Elevation: 130 feet  
Mouth: Tampa Bay  
Drainage area: 225 square miles

**Wimauma Station:**

County: Hillsborough  
Period-of-record: 1939  
Location: 15 miles upstream from mouth  
Drainage area: 149 square miles

**JOSEPHINE CREEK (Southern Region)**

Total length: 12 miles  
Headwaters: Lake Josephine in central Highlands County  
Elevation: 80 feet  
Mouth: Lake Istokpoga in Highlands County  
Drainage area: 143 square miles

**DeSoto City Station:**

County: Highlands  
Period-of-record: 1946  
Location: 4.9 miles upstream of mouth  
Drainage area: 109 square miles

**MANATEE RIVER (Southern Region)**

Total length: 45 miles  
Headwaters: Four corners area Hillsborough, Polk, Hardee and manatee Counties.  
Elevation: 130 feet  
Mouth: Tampa Bay  
Drainage area: 330 square miles

**Myakka Head Station:**

County: Manatee  
Period-of-record: 1966  
Location: 36 miles upstream from mouth  
Drainage area: 65.3 square miles

**MYAKKA RIVER (Southern Region)**

Total length: 54.1 miles  
Headwaters: Western Hardee and Eastern Manatee Counties  
Tributaries: Howard Creek, Deer Prairie, and Big Slough Canal  
Elevation: 105 feet  
Mouth: Charlotte Harbor  
Drainage area: 540 square miles

**Sarasota Station:**

County: Sarasota  
Period-of-record: 1936  
Location: 36 miles upstream from mouth  
Drainage area: 229 square miles

**PEACE RIVER (Central and Southern Region)**

Total length: 120 miles  
Headwaters: Green Swamp in northern Polk County through Lake Hancock, Winter Haven chain of lakes, and Lake Hamilton.  
Tributaries: Peace Creek Canal, Saddle Creek, Charlie Creek, Prairie Creek, Horse Creek, Joshua Creek and Shell Creek. Elevation: 110 feet  
Mouth: Charlotte Harbor  
Drainage area: 2300 square miles

**Arcadia Station (Southern Region):**

County: Desoto  
Period-of-record: 1931  
Location: 36 miles upstream from mouth  
Drainage area: 1367 square miles

**Bartow Station (Central Region):**

County: Polk  
Period-of-record: 1939  
Location: 105 miles upstream from mouth  
Drainage area: 390 square miles

# Selected Spring Monitoring Stations

## Selected Spring Monitoring Stations

<u>Map ID</u>	<u>Site Name</u>
1	Lithia Main Spring
2	Buckhorn Main Spring
3	Sulphur Springs at Sulphur Springs
5	Weeki Wachee River near Brooksville
6	Rainbow Springs near Dunnellon
7	Silver Springs near Ocala

## **SPRINGS MONITORING STATIONS**

### **RAINBOW SPRINGS (Northern Region)**

County:	Marion
Basin:	Withlacoochee River
Magnitude:	1 <sup>st</sup>
Discharge measurement location:	5 mi downstream from head of springs
Discharge contributes to:	Rainbow River, Withlacoochee River
Public Access:	Yes
Period-of-record:	1965
Gage:	Non-recording gage

### **SILVER SPRINGS (Northern Region)**

County:	Marion
Basin:	Ocklawaha River
Magnitude:	1 <sup>st</sup>
Discharge measurement location:	4 to 5 mi downstream from head of springs
Discharge contributes to:	Silver Springs River, Ocklawaha River, St. Johns River
Public Access:	Yes
Period-of-record:	1932
Gage:	Water-stage recorder

### **WEEKI WACHEE SPRINGS (Northern Region)**

County:	Hernando
Basin:	Coastal Rivers
Magnitude:	1 <sup>st</sup>
Discharge measurement location:	1 mi downstream from head of springs
Discharge contributes to:	Weeki Wachee River
Public Access:	Yes
Period-of-record:	1993
Gage:	Water-stage

### **SULPHUR SPRINGS (Central Region)**

County:	Hillsborough
Basin:	Hillsborough River
Magnitude:	2 <sup>nd</sup>
Discharge measurement location:	300 ft downstream from gage
Discharge contributes to:	Hillsborough River
Public Access:	Yes
Period-of-record:	1956
Gage:	Water-stage recorder

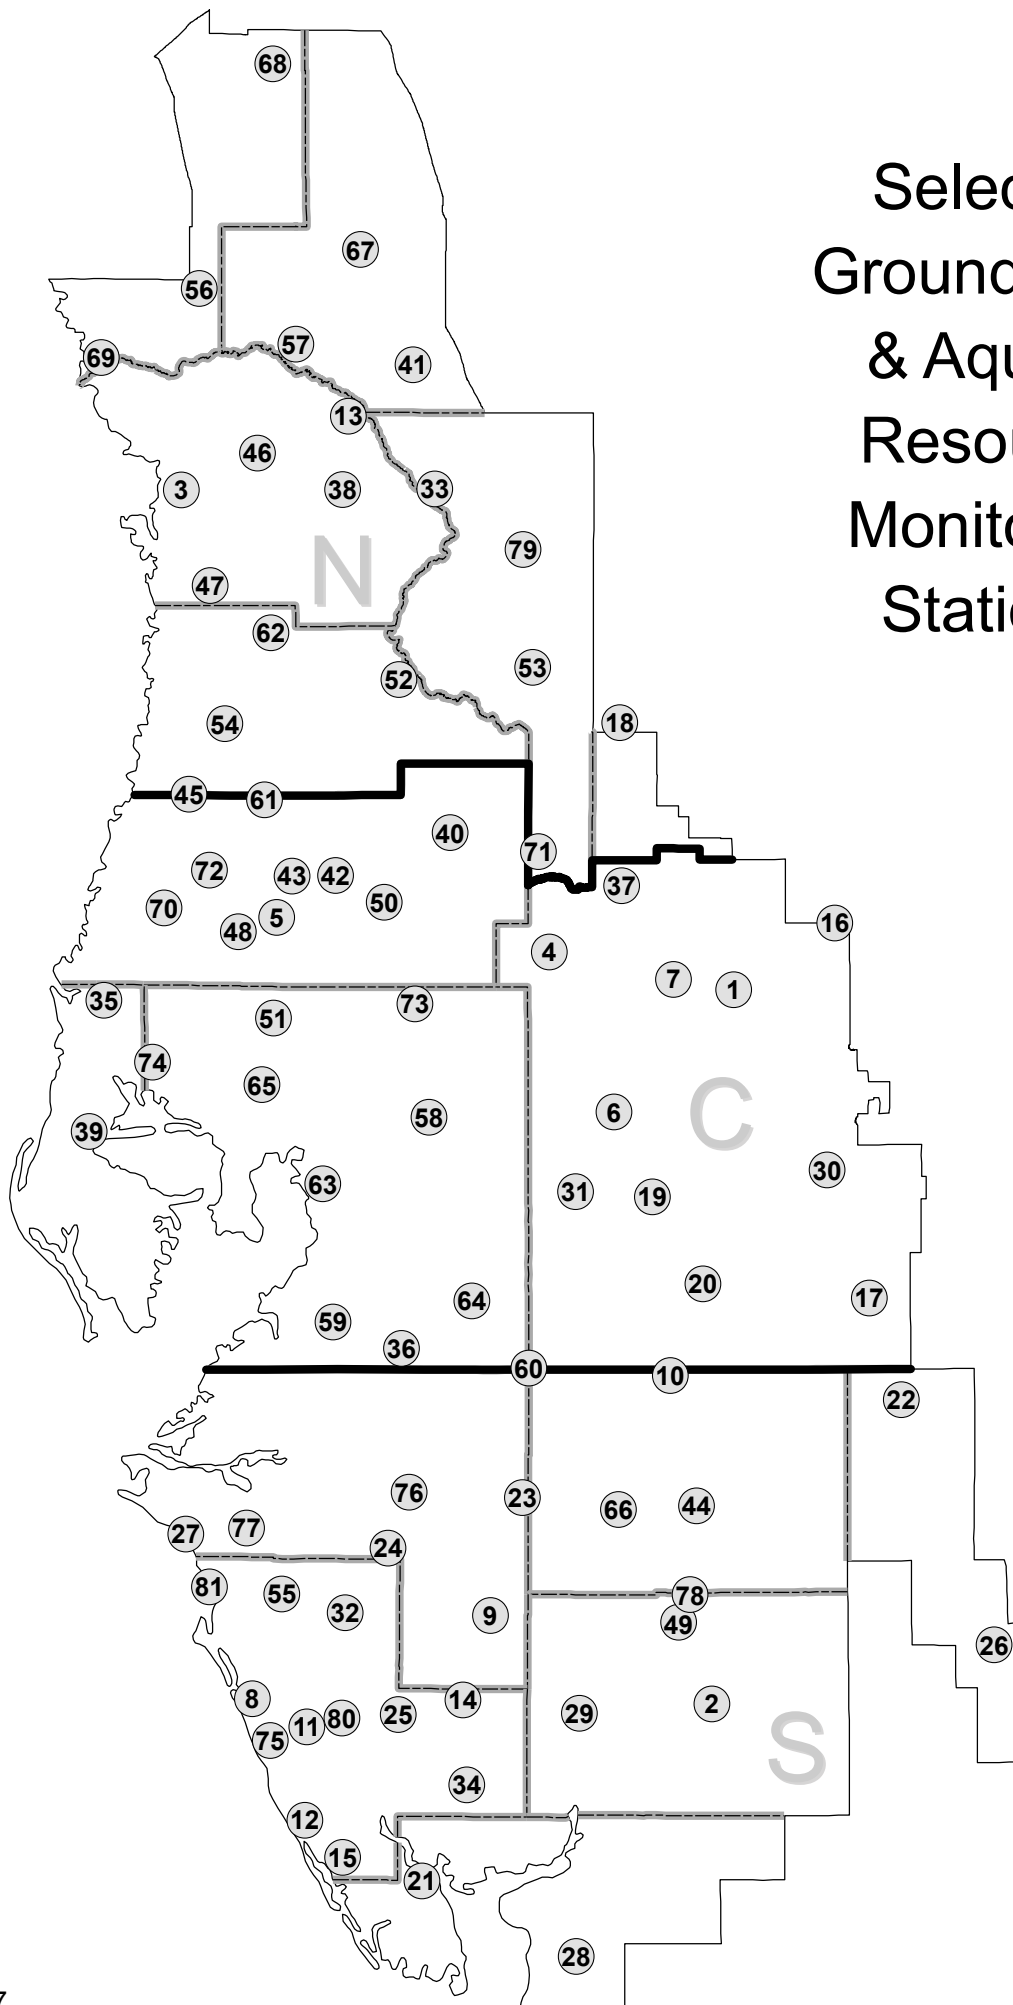

**BUCKHORN SPRINGS (Central Region)**

County:	Hillsborough
Basin:	Alafia River
Magnitude:	2 <sup>nd</sup>
Discharge measurement location:	Difference between discharge measurements of Buckhorn Creek made 25 ft upstream from and 100 ft downstream from Buckhorn Springs
Discharge contributes to:	Buckhorn Creek, Alafia River
Public Access:	No
Period-of-record:	1987
Gage:	Water-stage recorder

**LITHIA SPRINGS: (Central Region)**

County:	Hillsborough
Basin:	Alafia River
Magnitude:	2 <sup>nd</sup>
Discharge measurement location:	50 feet downstream from main pool
Discharge contributes to:	Alafia River
Public Access:	Yes
Period-of-record:	1934
Gage:	Water-stage recorder

# Reservoir Locations

## DESCRIPTION OF PUBLIC SUPPLY SURFACE WATER RESERVOIRS

**CITY OF TAMPA RESERVOIR (Hillsborough River Basin):** Constructed in 1924, it is located on the Hillsborough River in Hillsborough County. It is the fourth largest public supply surface water facility in the District. It is the main water supply for the City of Tampa and has a total storage capacity of 1.7 billion gallons (bg). The total usable volume is 1.4 bg, when the reservoir elevation is 22.5 feet NGVD. It is an in-stream reservoir with a depth that ranges between nine and 22 feet. Given this amount of water, it is estimated that a 15-day supply of water is available from this facility over an extended dry period. During periods of low water due to drought conditions, the facility is permitted to pump water from two alternate sources. The first of these two sources is the Tampa Bypass Canal. Water is pumped over the water control structure at S-161 into the Hillsborough River above the dam. The second source is Sulphur Springs, just downstream from the dam, where water is captured at the spring and pumped back behind the dam. Withdrawals from both sources are in strict accordance with pumpage schedules as outlined in the facility's water use permit. When water levels fall below 12 feet NGVD, water cannot be withdrawn because the reservoir level is below the intake pipes. The permitted average daily withdrawal for this facility is 82 mgd, with a permitted maximum daily withdrawal of 104 mgd. Currently, ground water wells are not used to augment this facility. The minimum producible level is 9.00 feet.

### **PEACE RIVER RESERVOIRS - PEACE RIVER/MANASOTA REGIONAL WATER**

**SUPPLY AUTHORITY (Peace River Basin):** The Peace River reservoirs are located in southwestern DeSoto County. They are an off-stream reservoir system consisting of two reservoirs that store surface water captured from the Peace River during wet periods. The first reservoir, Reservoir 1, was built in 1980 and encompasses approximately 85 acres, has a water depth of approximately 31 feet, and has a total storage capacity of approximately 625 million gallons. The second reservoir, Reservoir 2, was built in 2009, covers about 616 acres, has a water depth of approximately 35 feet, and has a total storage capacity of about 6.0 billion gallons. The PRMRWSA facility ranks as the third largest in the District for total volume storage and supplies water to Charlotte, DeSoto, Manatee and Sarasota counties and to the City of North Port. The facility also uses an aquifer storage recovery (ASR) system for storing treated water pumped from the river. The minimum producible level at Reservoir 1 is Elevation 8.0 feet, while Reservoir 2 is Elevation 27.0 feet.

**MANATEE RESERVOIR (Manasota Basin):** Completed in 1967 by the damming of the Manatee River, the Manatee Reservoir is the second largest of the six surface-water public supply facilities within the District. Located in Manatee County, this in-stream facility has a storage capacity of 7.5 bg. The service area of the Manatee reservoir is the unincorporated portions of Manatee County, the City of Palmetto and Anna Maria Island, and also the Sarasota SUD#1. This reservoir provides essentially all public supply for Manatee County, with the exception of the City of Bradenton. The total size of this reservoir is 1800 acres with an average depth of 15 feet. With the reservoir full, the

facility has approximately 220 days of available water supply. When the surface-water elevation drops below 21.0 feet, water cannot be withdrawn because levels are below the facility's intakes. The permitted average daily withdrawal for this facility is 34.9 mgd, with a permitted peak monthly quantity of 41.9 mgd. The minimum producible level is 21.00 feet.

**EVERS RESERVOIR (Manasota Basin):** Constructed in 1935 and expanded in 1985, it is located on the Braden River in Manatee County. This is the fifth largest public supply reservoir in the District. Its main service area is the City of Bradenton and approximately 500 customers outside the city. It has a total storage capacity of 1.5 bg. The total size of the facility is 300 acres with an average depth of 12 feet. Water ceases to flow over the dam when the level falls below 3.84 feet NGVD. During the 1985 drought, while expansion of the facility was taking place, the water level dropped to one foot below sea level and demand was still met. Given a completely full reservoir, with no water going over the spillway, it is estimated the facility could supply water for approximately 260 days, with no input from rainfall. The permitted average daily withdrawal for this facility is 6.95 mgd, with a permitted peak monthly quantity of 8.13 mgd. Currently, ground-water wells are not used to augment this facility.

**SHELL CREEK RESERVOIR (Peace River Basin):** Shell Creek Reservoir, located in Charlotte County, is the sixth largest surface water system within the District. This system was built in 1964 and services the City of Punta Gorda as well as unincorporated areas surrounding the city limits. The Shell Creek Reservoir is fed by two primary tributaries, Shell Creek from the east and Prairie Creek from the northwest. The total drainage area at Hendrickson Dam is 373 square miles. It has a surface area of 800 acres and depths of 10 to 12 feet. Total storage capacity is 765 mg. Even with this low volume of water, personnel at this facility estimate they have approximately 125 days of available supply with no input from rainfall. Water ceases to flow across the weir when surface elevations drop below 5.0 feet NGVD, and at 3.7 feet NGVD water quality becomes a major concern. When surface elevations drop below 1.75 feet NGVD, the water is below the intakes and withdrawal of water is not possible. The permitted average daily withdrawal by this facility is 5.358 mgd, with a permitted peak monthly quantity of 6.901 mgd. The minimum producible level is 1.70 feet.

**C.W. BILL YOUNG REGIONAL RESERVOIR - TAMPA BAY WATER (Alafia River Basin):** Constructed in early 2005, it is the largest public supply surface water facility in the District. Located in southern Hillsborough County, it is an off-stream reservoir that stores surface water skimmed from the Tampa Bypass Canal and Alafia and Hillsborough Rivers. It services the Tampa Bay region through the Tampa Bay Water regional public supply water distribution system. The reservoir has an estimated storage capacity of 15.0 bg when the water level elevation is 136.5 feet NGVD. The reservoir is approximately 45 feet deep, two miles long and one mile wide, and encompasses a land area of approximately 1,100 acres. It reportedly has the capacity to provide 25 percent of the Tampa Bay region's public supply needs for six months and can supply the Tampa Bay regional surface water treatment plant at full capacity for 227 days.
