

## TECHNICAL MEMORANDUM

May 26, 2010

TO: Interested Parties

THRU: Kathy F. Scott, Manager, Conservation Projects Section  
Resource Projects Department

FROM: Carl P. Wright, Senior Water Conservation Analyst  
Conservation Projects Section  
Resource Projects Department

SUBJECT: 2010 Regional Water Supply Plan: Industrial/Commercial and Mining/Dewatering  
Water Demand Projections

---

### **Introduction**

Chapter 373, Florida Statutes (F.S.) sets forth the requirement for regional water supply planning. Under the provisions of this chapter, a Regional Water Supply Plan (RWSP) must be developed for those areas where available water supplies are not expected to meet projected demands over a 20-year planning horizon. Guidance for developing projections is contained in the publication Final Report: Development and Reporting of Water Demand Projections in Florida's Water Supply Planning Process (September 2001). This guidance document was produced by the Water Demand Projection Subcommittee of the Water Planning Coordination Group. This group includes representatives from the Florida Department of Environmental Protection (FDEP) and each of the five water management districts. Following a district-wide water supply assessment that identified water demands and existing sources, the Governing Board of the Southwest Florida Water Management District (SWFWMD or District) determined the need for a RWSP in the southern ten counties of the District, and the District produced its first RWSP in 2001. The statute requires that the determination of the need for a RWSP be made every five years. Accordingly, in 2003, the Governing Board determined the need for a RWSP existed in the same ten-county area. For the 2010 edition of the Regional Water Supply Plan, the Governing Board directed District staff to include demand projections for all sixteen (16) counties within the District.

### **Purpose**

This memo details the methodology used to develop water demand projections for industrial/commercial (I/C) and mining/dewatering (M/D) interests within the SWFWMD. I/C uses include chemical manufacturing, food processing, power generation, and miscellaneous I/C uses. While diversified, much of the water used in food processing can be attributed to citrus and other agricultural crops. For the most part, chemical manufacturing is closely associated with phosphate mining and consists mainly of phosphate processing. A number of different products are mined within the District's boundaries, including phosphate, limestone, shell, and sand. For the purposes of the water supply planning process, thermoelectric power generation (PG) is separated out as an individual use category. While the Water Demand Projection Subcommittee (FDEP, 2001) identified 0.1 million gallons per day (mgd) as the mandatory reporting threshold for the I/C and M/D categories, the SWFWMD examined and included all permitted or reported uses, regardless of the quantity in projecting

demand. The decision to include all water use permits (WUPs), regardless of size, resulted from a belief that projection accuracy would be improved by capturing all available water use data.

## **Background**

Prior editions of the RWSP addressed two planning regions, the Southern Water Use Caution Area (SWUCA) and Northern Tampa Bay (NTB). Although data is still available for these two areas, the 2010 RWSP will address four planning regions encompassing all 16 counties. The Southern Planning Region includes Manasota, Sarasota, DeSoto, and Charlotte Counties; the Heartland Planning Region includes Polk, Hardee, and Highlands Counties; and the Tampa Bay Planning Region includes Pasco, Pinellas, and Hillsborough Counties. The Northern Planning Region consists of those counties being included in the RWSP for the first time, specifically Hernando, Citrus, Levy, Sumter, Lake, and Marion Counties. For the 2010 RWSP, 2005 is the starting point, or baseline year, for the purpose of developing and reporting water demand projections. This is consistent with the methodology agreed upon by the Water Planning Coordination Group (FDEP, 2001). The data for the baseline year consist of reported and estimated usage for 2005, whereas data for the years 2010 through 2030 are projected demands (estimated needs).

## **Data Source**

District rules require a water use permit (WUP) for uses where the withdrawal during any single day is one million (1,000,000) gallons, if the average annual daily withdrawal is equal to or greater than one hundred thousand (100,000) gpd, or if the withdrawal is from a well having an inside diameter of six-inches (6") or more. Because of the six-inch diameter provision, the reporting threshold of 0.1 mgd for I/C and M/D adopted by the Demand Projection Subcommittee is not equivalent to the District's permitting threshold. It is interesting to note that some I/C permittees with six-inch or larger wells are permitted for quantities as small as 100 gpd. On the other hand, a self-supplied water user with a well smaller than six-inches may withdraw thousands of gallons a day, yet be exempt from WUP requirements (if they withdraw less than 100,000 gpd). Since WUP information is contained in the District's regulatory data base, it was used to identify all water use permits which included any permitted quantities for use codes

indicating I/C or M/D operations in the sixteen (16) county planning area. A total of 426 individual I/C and M/D permits were identified. Some self-supplied small users are not issued WUPs (under 100,000 gpd or well diameter smaller than 6-inches), an undetermined amount of M/D and I/C use is not reported. Without a WUP, there is no practical way to identify small commercial operations which fall below the District's permitting threshold. For example, every fast food restaurant is actually a commercial operation, using a daily quantity of water that most likely falls below the District's permitting threshold. However, many of these small I/C operations are located in urban areas, obtain their water via the public supply system rather than wells, and will be accounted for under the demand projections for public supply.

## **Methodology**

In gathering data for the initial RWSP in 2000 (published in 2001), a survey form was sent to all permit holders. The survey requested the permit holder supply information related to anticipated water needs at five-year intervals from 2000 to 2020, as well as existing or planned conservation measures. In addition, telephone contact was attempted with each permittee to explain the purpose of the survey. The data submitted by permittees was determined to be invalid (overinflated), and ultimately discarded. As a result, universal contact with permittees was not attempted for the 2005 update of the RWSP (published in 2006), and has not been attempted in any additional attempts at demand projection, including 2010. Projections for 2010 were developed by multiplying permitted quantity data extracted from the District's Water Management Information System (WMIS) on October 23, 2008 by the percentage of actual use for the I/C and M/D categories on a county-by-county basis. The percentage of permitted quantity used in each county was calculated by dividing total estimated county use by the county's permitted quantity in each category for the years 2001 through 2006, using data extracted from the District's yearly Estimated Water Use reports. During this six year period, 38.2 percent of M/D permitted quantities, and 42.1 percent of I/C permitted quantities were actually reported as used District-wide. However, the percentage of permitted quantity actually used in the I/C and M/D categories varies significantly from county-to-county. Table 1 displays the county-by-county percentages used to project demand in the I/C and M/D categories. When data was available, the percentage of permitted quantity actually used by each PG WUP holder was calculated and used to project water demand on a permit-by-permit basis. When individual power plant data was not available, the District-wide average use for PG was used to project water demand.

When the 2000 RWSP was completed, it was noted that "the District has experienced a tremendous amount of volatility in the number of I/C and M/D WUPs in a short period of time." Because current projections are based on all WUPs and not just those exceeding 100,000 gpd, and will include all 16 counties rather than the ten used in 2000 and in 2005, an examination of permit volatility could be misleading. Even though

they were not included in the 2005 RWSP, demand projections were developed for the northern six counties. A comparison of currently existing WUPs with those that existed when the 2005 demand projects were compiled indicates that permit volatility remains a significant factor. There were 426 WUPs as of October 23, 2008. This number includes 90 newly issued WUPs not in existence in 2005, 63 that were not captured in 2005, and 90 that existed in 2005 but have since been deleted. The total number of changes adds up to 243. This equates to a net change of 57 percent in total permits since data for the 2005 RWSP was compiled. Therefore, permit volatility must be considered when attempting to project water demand over a 20-year period. Because of permit volatility, it is conceivable, even probable, that new permits have been issued and others have been deleted or expired since October 23, 2008. Thus, the 2010 projections are based upon a "snapshot in time."

## **Review**

The District has provided this technical memorandum and demand projection tables to water use permit staff and Industrial/Commercial, Mining/Dewatering sector stakeholders for review and comment, as each permitting staff and stakeholder may have a much more intimate understanding of the permits for which they are responsible. Upon receiving stakeholder comments, the District reviewed suggested changes and if appropriate included updates. It is important to note that as this is a long term planning effort, methodology changes based on short

term trends were not taken into account. Comments and suggested changes were only taken into consideration if they were justifiable, defensible, based on historical regression data and long term trends, and supported by complete documentation. It was during the review by regulatory staffs that questions related to entrainment quantities associated with some mining operations arose. Because mining operations generally continue whether the product being mined is saturated or relatively dry, it was decided that entrainment quantities, for the most part, were not necessary for the mining process to proceed and should therefore not be treated as a demand. Projections revised by regulatory staff are identified on Table 4: Water Demand Projections; Industrial/Commercial and Mining/Dewatering WUPs in the column labeled as Source. The projections were presented to and reviewed by the Industrial Advisory Committee (IAC).

The District understands and shares stakeholder's concerns of how critically important accurate demand projections are, however must comply with Chapter 373.0361, Florida Statutes (F.S.) which sets forth requirements for regional water supply planning.

## Tables and Figures

Table 1 (Percentage of Permitted Quantity Used) details the percentage of water used in relation to the actual permitted quantity for the years 2001 through 2006 for both the I/C and M/D category. Pages 1 and 2 list the county-by-county data by use category for each year. Page 3 displays the six year average by county used to calculate the 2010 demand projections. Demand projections for the previous, that is, the 2005 edition of the RWSP utilized the percentage of water used in relation to the actual permitted quantity for the years 1998 through 2001. Because of permit volatility as well as changes in permitting practices and reporting requirements, it is believed that a short, recent historic use period will result in more accurate demand projections than one using more years which includes older use data.

Table 2 (Historic Usage and Water Demand Projections in 16 County Area) displays water use in the baseline year (2005), projected demand in 2010 and 2030, and the difference in water use in 2005 versus projected demand in 2030. Table 2 displays data both by use category and by planning region.

Table 3 (Correlative Data; Industrial/Commercial and Mining /Watering WUPs) lists the correlative data for all I/C, M/D, and PG water use permits for which water demand projections were developed.

Table 4 (Water Demand Projections; Industrial/Commercial and Mining/Dewatering WUPs) is closely related to Table 3, but contains 2005 usage data and water demand projections in five-year intervals from 2010 through 2030, rather than statistical data.

Figure 1 (Net Change from Baseline Year 2005 to 2030) is a map displaying the net change in water use from 2000-2025, by county.

## **Summary**

It is expected that I/C and M/D water use will remain relatively constant or increase slightly over the twenty (20) year period from 2010 through 2030. The 5-year interval projections (2015, 2020, 2025, and 2030) assume a modest demand increase of 3 percent every five years. This projection methodology, based on percentage of permitted quantity actually used, was chosen because it proved to be more accurate in the 2000 RWSP (published in 2001) than projections based upon permittee supplied data. Also, it should be noted that development of new water sources will most likely not be needed to meet projected demand in the I/C and M/D use sector. Because this sector is currently using less than 50 percent of its permitted quantity, any increase in use would be available from already permitted quantities.
